Hard magnetic materials

A detailed list of contents can be found on the third page of each section

This 1966 edition is a completely revised and enlarged version of the preceding one, containing data on all our products. For a number of these products, separate booklets are available giving all necessary information and replacing the previous 'EP catalogue sheets'.
Generally, the type numbers indicate preferred types; however, the fact that a certain type is entered in this book does not necessarily imply its immediate availability.

As our research and development departments are engaged on continually perfecting our components and materials, the specification of a certain product may be found to have improved during the currency of this book.
We are sure that this book will be a useful guide to all who want to make a quick and correct choice from the great variety of products that we offer to the electronic industry, products that form the basis of the economic manufacture and maintenance of highly reliable electrical and electronic equipment

${ }^{1}$ Tolerance $\pm 150 \mathrm{kc} / \mathrm{s}$; ${ }^{2}$ tolerance $\pm 250 \mathrm{kc} / \mathrm{s}$; ${ }^{3}$ as $\mathrm{V}_{b}$ falls from 6 V to 4 V ; ${ }^{4}$ measured at a distance of 30 m ;
${ }^{5}$ measured at a distance of 3 m (IEC norm)

## TYPE AT7638, AT7639, AT7640, AT7641

This turret type tuner has been developed for reception of television signals in bands $I$ and III ( $41-68 \mathrm{Mc} / \mathrm{s}$ and $174-223 \mathrm{Mc} / \mathrm{s}$ resp.) The standard CCIR tuner has 10 channels with printed coil strips. During manufacture it is possible to replace these by any desired range of channels. When a special transmitter must be received, there is the possibility of inserting this particular channel, e.g. channel 2a for Austria or OIR2 for Finland, etc. For this purpose, the turret has two spare positions.

Not to be used for first equipment design.

The tuner is provided with the low-noise tube PCC189 operating as an RF cascode amplifier with excellent cross-performance. In the oscillator and mixer stage a PCF86 is used. Due to the high mutual conductance of the pentode section of the PCF86, the IF gain is increased by about a factor of 2, the total overall gain of the tuner now being 40 dB .

TYPE AT7639, AT7641 (WITH CASCADE SWITCH)

## TYPE AT7650

This very small VHF tuner has a 13-position turret switch equipped with $10 \mathrm{VHF}-\mathrm{CCIR}$ channel strips (channels $2-11$ ), covering the frequency bands I and III ( $41-68 \mathrm{Mc} / \mathrm{s}$ and $174-223 \mathrm{Mc} / \mathrm{s}$ resp.)
The tuner has a memo-matic system which can be adjusted to each individual channel.
The tubes used are type PC900 (RF stage) and type PCF801 (oscillator/mixer). Due to a careful design this tuner meets the German Post Office requirements as regards radiation.
Life tests carried out on the reset stability revealed that $\triangle \mathrm{f}_{\text {osc }}<150 \mathrm{kc} / \mathrm{s}$ when the tuner is switched from one channel to another and back again.
Provision is made for UHF-IF injection on the grid of the mixer pentode. The influence of this circuit on the shape of the RF bandpass curve is negligible. The gain is approximately 50 times (for a 3 dB IF bandwidth of $6 \mathrm{Mc} / \mathrm{s}$ ).

TYPE AT7650

## VHF TUNERS FOR TV

## AT7650T, AT7651T and AT7652T

These transistorized VHF tuners have a 13-position turret switch equipped with up to $11 \mathrm{VHF}-\mathrm{CCIR}$ channel strips (channels 2-12), covering the frequency bands I and III ( $41-68 \mathrm{Mc} / \mathrm{s}$ and 174-223 $\mathrm{Mc} / \mathrm{s}$ ). The tuners have the same memomatic system as used in the VHF tuner AT7650; each individual channel can be adjusted. The RF stage is equipped with a transistor AF180; the mixer and the oscillator are both equipped with an AF178. Forward AGC can be applied to the RF stage ; a gain reduction of approximately 40 dB can thus be obtained.

Differences between the types:
AT7650T has no VHF-bridge in circuit.
AT7651T and AT7652T are equipped with a UHF-bridge in circuit (extra IF gain approximately 10 dB ). The total gain from the antenna to the first IF amplifier exceeds 26 dB at 3 dB IF bandwidth of $6.5 \mathrm{M} / \mathrm{s}$ and is flat within $5 \%$.

## VHF TUNERS FOR TV

AT7650T, AT7651T AND AT7652T

## UHF TUNERS FOR TV

## TYPE AT6354

This tuner has been developed for the reception of television signals in bands IV and $V$ ( $470-862 \mathrm{Mc} / \mathrm{s}$ ). Standard CCIR-IF frequency: sound $33.4 \mathrm{Mc} / \mathrm{s}$, picture carrier $38.9 \mathrm{Mc} / \mathrm{s}$.
The RF stage is equipped with a PC88 in groundedgrid circuit; the oscillator/mixer employs a PC86. The gain is approximately 10 dB (for a 3 dB IF bandwidth of $6 \mathrm{Mc} / \mathrm{s}$ ).

This tuner is a transistorized version of type AT6354. The gain is approximately 14 dB (at a 3 dB bandwidth of $6 \mathrm{Mc} / \mathrm{s}$ ).

base HF transistor +12 V
emitter HF transistor +12 V

## UHF TUNERS FOR TV

## TYPE AT6380 AND AT6381

This tuner, which is continuously tunable, has been developed for the reception of television signals in bands IV and V (470-890 Mc/s).
The tuner should preferably be provided with a gearing to obtain a total ratio of about $1: 40$.
The maximum permissible axial torque on the tuner spindle is $7 \mathrm{~kg} . \mathrm{cm}$. The gain is approximately 14 dB (for a 3 dB bandwidth of $6 \mathrm{Mc} / \mathrm{s}$ ).
These two types of tuner are electrically identical, the mere difference being that the resistors of tuner AT6381 are mounted on a printed-wiring board. The figure shows both the printed-wiring board on top of tuner AT6381 and the terminals on top of tuner AT6380.

TYPE AT 6380 AND AT6381

TYPE AT6385

This tuner is the push-button version of the AT6380 and AT6381 types.
Tuner type AT6386 differs from type AT6385 in that the switch for the $B+$ voltage and $A G C$-line has been omitted.

## DEFLECTION COMPONENTS FOR TV

## LINE OUTPUT TRANSFORMER TYPE AT2025

Preferred type for tube sets with either conventional or printed wiring with non-inflammable coils.

(supply voltage 240 V )
System 525/625 lines
Deflection $110^{\circ}$ or $114^{\circ}$
EHT 18 kV stabilized
Deflection unit AT1011, AT1019 or AT1030
Linearity control AT4032 or AT4034
Line output tube PL500
Booster diode PY88
EHT rectifier DY87
VDR resistor E298 GD/A265
Two circuits are shown.
In Fig. 1 the S-correction capacitor $\mathrm{C}_{\mathrm{s}}$ is connected between the two halves of the secondary. In Fig. 1a $\mathrm{C}_{\mathrm{s}}$ is connected directly in series with the deflection unit. The advantage of the first circuit is that the booster capacitor $\mathrm{C}_{\mathrm{B}}$ requires a much lower value.
Moreover, a 90 V p-p parabolashaped voltage is available from terminal 3.
The table below gives measured results obtained with a 120 pF ceramic capacitor $C_{1}$ connected between (6) and (3). The capacitance between terminals (1) and (4) is 100 pF .

[^0]
## DEFLECTION COMPONENTS FOR TV

LINE OUTPUT TRANSFORMER TYPE AT2025
In the design of type AT2025 special attention has been paid to mounting (and dismounting) facilities. Its mounting height is less than that of its predecessor, type AT2023/01.
The transformer can be mounted on metal chassis or on printed-wiring boards. There are four pins and two threaded holes available for the mechanical mounting. The pins can be bent or soldered for fixing the transformer to the chassis.
The electrical connections are made to wire pins which in this design lie in straight lines.

This transformer satisfies the most stringent safety requirements. Both the primary and the EHT coils are made self-extinguishing by a special impregnation technique.

## LINE OUTPUT TRANSFORMER TYPE AT2026 AND AT2031/01

Type AT2026 is mechanically identical to type AT2025, but was specially developed for 625/819 lines in multistandard tube sets (EHT 18 kV ).

Type AT2031/01 is mechanically identical to type AT2023/01, but was specially developed for 625/819 lines in multistandard tube sets (EHT 17 kV ).

## DEFLECTION COMPONENTS FOR TV

## LINE OUTPUT TRANSFORMER TYPE AT2023/01.

This type of transformer is designed for tube sets and is suitable for both conventional and printed wiring. (It should not be used for new designs.)

System 525/625 lines
EHT 17.5 kV stabilized
Deflection unit AT1011, AT1019 or AT1030
Linearity control AT4032 or AT4034
Line output tube PL500
Booster diode PY88
EHT rectifier DY87

This control unit designed for tube sets consists of a coil located in a biasing field between two ferroxdure ring magnets. To adjust the linearity, a ferroxcube core can be moved axially in the coil and magnetic rings, thus controlling the degree of saturation of the inductance. The ferroxcube core has been provided with an insulating grip and is held in position by means of a siliconrubber ring.

The unit has been designed for use in combination with deflection unit AT1011 and line output transformer AT2023 or AT2025.

The unit can be mounted either on printedwiring boards, by means of its connecting pins, or on conventional panels, by means of two screws through the holes in the pads.

## DEFLECTION COMPONENTS FOR TV

## ADJUSTABILE LINEARITY CONTROL TYPE AT4034

This unit is designed for use in TV sets equipped with tubes, to adjust the linearity of the line deflection. It can be used in combination with deflection unit AT1011, AT1019 or AT1030 and line output transformer AT2023/01, AT2025, AT2026 or AT2031/01.

This deflection unit is designed for tube receivers; it can be used for $19^{\prime \prime}$ and $23^{\prime \prime} 110^{\circ}$ rectangular picture tubes. The windings of the coils of the unit have been constructed so as to minimize raster distortion on the screen of a $19^{\prime \prime}$ or $23^{\prime \prime}$ rectangular tube. This unit offers several possibilities for fine adjustment of the raster shape, but for the convenience of the setmakers it is adjusted before delivery for optimum raster shape on an average picture tube. The various adjustments, summarized below, are achieved by:

1. Two sliding magnets for the compensation of horizontal pin-cushion distortion, i.e. for straightening the upper and lower sides of the raster.
2. Two adjustable cylindrical magnets for the compensation of vertical pin-cushion distortion, i.e. for straightening the left- and righthand sides of the raster. These magnets are diagonally magnetised and can be turned between pole shoes for the correct magnetic field distribution. The adjustment is marked with paint.
3. The pole shoes are also adjustable, that is to say, they slide on the cap of the deflection unit. This adjustment allows compensation of certain non-symmetric errors (trapezium distortion).
The pole shoes are adjusted before delivery for optimum raster shape on a test tube; this position is indicated by a dot.
4. Small rubber magnets can be attached to the pole shoes. These flat square magnets are provided with a hole in the centre which fits the lips of the pole shoes that are bent outward. By turning these magnets the shape of the corners of the rasters can be adjusted. They are supplied separately under type number AT7114.
5. Centring magnets for centring the raster on the picture tube face.

## DEFLECTION COMPONENTS FOR TV

## DEFLECTION UNIT TYPE AT1011

|  | frame coils |  | line coils |  |
| :---: | :---: | :---: | :---: | :---: |
| inductance <br> resistance <br> deflection current (peak-to-peak) <br> at 18 kV for a deviation of | $\begin{gathered} 82 \mathrm{mH} \\ 48 \Omega^{\mathrm{r}} \\ 455 \mathrm{~mA} \\ 380 \mathrm{~mm} \end{gathered}$ |  | $\begin{aligned} & 2.9 \mathrm{mH} \\ & 4.6 \Omega \\ & 2.2 \mathrm{~A} \\ & 500 \mathrm{~mm} \end{aligned}$ |  |

${ }^{1}$ Including NTC-resistor R.

The component parts of the deflection unit are embedded in polyester resin. The horizontal and vertical coils are adjusted for minimum coupling before being embedded, so that the "cross talk" from line to frame coils is kept to a minimum.
The picture height must remain constant even in frame-output circuits with voltage feedback. For this purpose, an NTC-resistor is connected in series with the frame coils. For optimum heat transfer this resistor is contained in the same casting as the frame coils. So the coils and the NTC-resistor have practically the same temperature under all conditions which is especially important during the warmup period.
If a frame-output circuit with current feedback is used, the NTC-resistor can be left out by using the soldering tag $V$ between frame coil and NTC-resistor.

This unit, designed for tube receivers, is electrically identical to deflection unit AT1011

The windings of the coils of deflection unit type AT1019 have been designed for minimum raster distortion on the screen of a $19^{\prime \prime}$ and $23^{\prime \prime}$ rectangular tube. In addition, this unit offers several possibilities for fine adjustment of the raster shape. The various adjustments, summarized below, are achieved by:

1. Two plastoferrite rod magnets for the compensation of horizontal pin-cushion distortion, i.e.for straightening the upper and lower sides of the raster. (Mounted inside the rim.)
2. Two adjustable cylindrical magnets for the compensation of vertical pin-cushion distortion, i.e. for straightening the left- and right hand sides of the raster. These magnets are diagonally magnetised and can be turned between pole shoes for the correct magnetic field distribution.
3. The pole shoes are also adjustable, that is to say, they slide in a groove of the rim of the deflection unit. This adjustment allows compensation of certain non-symmetric errors (trapezium distortion).
4. Small rubber magnets can be attached to the rim. These flat square magnets are provided with a hole in the centre which fits the pins on the rim. By turning these magnets the shape of the corners of the rasters can be adjusted. They are supplied separately.
5. Centring magnets for centring the raster on the picture tube face.

## DEFLECTION COMPONENTS FOR TV

DEFLECTION UNIT TYPE AT1019

| resistance . | $48 \Omega^{1}$ |  | $4.6 \Omega$ |  |
| deflection current (peak-to-peak) | 455 mA | $\underset{+R}{N T C} \sum_{\substack{\sum_{3} \\-T^{\circ}}}$ | 2.2 A |  |
| at 18 kV for a deviation of | 380 mm |  | 500 mm |  |

${ }^{1}$ Including NTC-resistor.

DEFLECTION UNIT TYPE AT1030

This deflection unit is designed for tube receivers; it can be used for $19^{\prime \prime}$ and $23^{\prime \prime} 110^{\circ}$ rectangular picture tubes.
The unit offers some possibilities for fine adjustment of the raster shape.
The adjustments, summarised below, are achieved by:

1. Two rod magnets, mounted on brackets, for compensating vertical pin-cushion distortion. Asymetrical pin-cushion distortion can also be corrected to some extent by bending the rod magnets asymmetrically.
2. Small rubber magnets which can be attached to the rim. These flat square magnets are provided with a hole in the centre which fits the pins on the rim. The shape of the corners of the raster can be adjusted by rotating these magnets. They are supplied separately.
3. Two plastic ferrite rod magnets which can be mounted in plastic slips on the rim. These magnets can be used to compensate horizontal (pin-cushion) distortion, i.e. to straighten the upper and lower edges of the raster. Each clip contains two slots of different size to accomodate rods with different diameters. It is also possible to use two plastoferrite rods inside the rim as in Type AT1019. ${ }^{1}$
4. Centring magnets for centring the raster on the picture tube face.

## DEFLECTION COMPONENTS FOR TV

## FRAME OUTPUT TRANSFORMER TYPE AT3507

The core of the transformer consists of two O-shaped yokes, formed by a number of bent laminations, with the coils wound around the two inner legs. The lower part of the transformer is embedded in polyester resin, in which apertures are left for mounting purposes. The maximum height and the relative positions of the apertures are shown in the figure.
The primary winding between the connections a and c is designed for a supply voltage of 220 V , whilst the connections $a$ and $b$ should be used if the supply voltage is 200 V .

FRAME OUTPUT TRANSFORMER 625/819 LINES, TYPE AT3508

The data are identical to those of type AT3507, but an extra winding has been provided for flyback suppression.

## DEFLECTION COMPONENTS FOR TV

## ACCESSORIES

Screened EHT cable type AT7116 with built-in $220 \mathrm{k} \Omega$ resistor.
Unscreened EHT cable type AT7117, without resistor.

EHT RECTIFIER SOCKET TYPE AT7108 WITH BUILT-IN $1.2 \Omega$ RESISTOR Designed for use in tube receivers.

## EHT RECTIFIER SOCKET TYPE AT7103/02.

Designed for use in transistorized receivers.
This type number covers:

| EHT cable | AT7116 |
| :--- | :--- |
| Rectifier socket | AT7108 |

## DEFLECTION COMPONENTS FOR TV

## FOR 11 INCH "TINYVISION" TRANSISTOR AND TUBE RECEIVERS

(These components are designed around picture tube A28-13W).
Two sets of components are available, one for tube receivers and one for transistorised receivers. They differ merely in the winding data.

A. For tube receivers the set comprises:

Deflection unit AT1021/01
Line output transformer AT2043
Linearity control unit AT4037
The essential data of the deflection unit are given below. To achieve temperature compensation, an NTC-resistor (cold resistance $32 \Omega$ ) shunted by a $12 \Omega$ carbon resistor, is connected in series with the $30 \Omega$ frame coils. In this way the total effective resistance (about $38 \Omega$ ) remains substantially constant over a wide temperature range.

| AT1021/01 | Lire coils | Frame coils |
| :---: | :---: | :---: |
| Inductance | 1.7 mH | 42 mH |
| Resistance | $3.6 \Omega$ | $38 \Omega$ |
| Sensitivity | $108 \mu \vee \mathrm{~s} / \mathrm{cm}$ | $9 \mathrm{~mW} / \mathrm{cm}^{2}$ |

The design of the line output transformer AT2043 is based on the use of the tubes PL81, PY81 or DY51 (or a semiconductor diode). The nominal supply voltage is $240 \mathrm{~V}_{\text {dc }}$; the transformer has to be used with VDR-stabiliser E298 GD/A265 in order to keep the anode voltage of the PL81 well above the knee so as to prevent the occurrence of Barkhausen oscillations.

## Further data

EHT voltage (no load) . . . . 11 kV
Booster voltage . . . . . $240+440=680 \mathrm{~V}$
Flyback time . . . . . . 17.5 \%
Average current . . . . . 32 mA ( 38 mA with DY51)
Overscan . . . . . . $+5 \%$
Extra windings . . . . . a. $7-8$ for heater supply of the picture tube: $11 \mathrm{~V}_{\mathrm{rms}}$ (or $38 \mathrm{~V}_{\mathrm{p}-\mathrm{p}}$ )
b. 5-6: $28 \vee_{p-p}$ for power supply of transistors in hybrid sets

## DEFLECTION COMPONENTS FOR TV

## FOR 11 INCH "TINYVISION" TRANSISTOR AND TUBE RECEIVERS

(These components are designed around picture tube A28-13W).
B. For transistorized receivers the set comprises:

Deflection unit AT1020/01
Line output transformer AT2042
Linearity control AT4036
The essential data of deflection unit type AT1020 are given below. The AT1020 has separate connections for both frame coils. Thus it is possible to connect them in series $(30 \Omega)$ or in parallel ( $7.5 \Omega$ ).

| AT1020/01 | Line coils | Frame coils |
| :---: | :---: | :---: |
| Inductance | $81 \mu \mathrm{H}$ | 42 mH |
| Resistance | $0.15 \Omega$ | $30 / 7.5 \Omega$ |
| Sensitivity | $23 \mu \mathrm{HV} \mathrm{s/cm}$ | 9 |

The design of the line output transformer AT2042 is based on the use of the line output transistor AU103, the parallel diode BY118 and the EHT rectifier DY51 (or a semiconductor diode). The stabilized supply voltage is 11 V .

## Further data:

EHT voltage (no load) . . . . . . 11 kV
Current . . . . . . . . . . 0.52 A
Flyback time . . . . . . . . . 17.5 \%
Overscan . . . . . . . . . . $+5 \%$
The data were, measured at a load of 0.9 W on the extra winding and including 0.77 W heater power for the DY51.).

## 100 series - CIRCUIT BLOCKS

## STANDARD UNITS FOR MEDIUM SPEED (max. frequency $100 \mathrm{kc} / \mathrm{s}$ )

Circuit blocks can in general be used in all digital data handling equipment such as for signalling, computing, controlling, measuring and testing, data handling, laboratory uses etc.

A circuit block is a small encapsulated unit containing basic electronic components, designed to accept and operate upon a specific type of input signal and to produce a specific type of electrical output. A number of different blocks can be combined to form larger parts of a reliable electronic digital system. The dimensions of all circuit blocks are approximately $54 \mathrm{~mm} \times 24 \mathrm{~mm} \times 11 \mathrm{~mm}$.
Out of one side of $54 \mathrm{~mm} \times 11 \mathrm{~mm}$ emerge ten wire terminals of 0.7 mm diameter and 15 mm length. The distances between the wires are $5.08 \mathrm{~mm}(0.2 \mathrm{in}$.) in accordance with the I.E.C. standard hole grid for printed-wiring boards. The blocks are colour-coded, a different colour being used for each group of functions.

Composition of the type number:
B8

## 100 series - CIRCUIT BLOCKS

## UNITS WITH A MEMORY FUNCTION

FF1 - FLIP-FLOP with internally connected trigger inputs

Type number: B9 92000
Colour: red
The circuit performs a memory function when driven by means of a d.c. level or a positive-going trigger signal (a.c. input signal). It can also be used as a scaler-of-two, driven by a positive-going trigger signal.

Terminals:

1. $\mathrm{Q}_{2}=$ output 2
2. $\mathrm{A}_{2}=$ a.c. input 2
3. $\mathrm{A}_{1}=$ a.c. input 1
4. $\mathrm{W}_{2}=$ d.c. input 2
5. $P_{2}=$ supply +6 V
6. $\mathrm{E}=$ common supply 0 V
7. $\mathrm{P}_{1}=$ supply +6 V
8. $\mathrm{N}=$ supply -6 V
9. $W_{1}^{\prime}=$ d.c. input 1
10. $\mathrm{Q}_{1}=$ output 1

FF3 - FLIP-FLOP with internally connected trigger inputs

Type number $\mathbf{B 8} 92002$
Colour: red
The circuit performs a memory function when driven by means of a d.c. level or a positive-going trigger signal, and it can also be used as a scaler-of-two when the trigger inputs are interconnected.

Terminals:

1. $\mathrm{Q}_{1}=$ output 1
2. $\mathrm{Q}_{2}=$ output 2
3. $\mathrm{A}_{2}=$ trigger input 2
4. $\mathrm{A}_{1}=$ trigger input 1
5. $W_{2}=$ d.c. input 2
6. $W_{1}=$ d.c. input 1
7. $\mathrm{K}=$ for external trigger input
8. $\mathrm{N}=$ supply -6 V
9. $\mathrm{P}=$ supply +6 V
10. $\mathrm{E}=$ common supply 0 V

## 100 series - CIRCUIT BLOCKS

## UNITS WITH A SIGNAL-GENERATING AND PULSE-SHAPING FUNCTION

## OS1 - ONE-SHOT MULTIVIBRATOR

Type number: B8 95001

## Colour: green

When a positive-going voltage step is applied to terminal $\mathrm{A}_{2}$ of this monostable multivibrator the circuit generates a pulse at the Q-terminals. The duration of the output pulse is determined by the value of the external capacitance between the terminals $W_{2}$ and $Q_{1}$.

Terminals:

1. $\mathrm{Q}_{2}=$ output 2
2. $\mathrm{A}_{2}=$ a.c. input 2
3. $W_{2}=$ d.c. input 2
4. $W_{2}=$ d.c.input 2
5. $\mathrm{N}_{2}=$ supply -6 V
6. $\mathrm{E}=$ common supply OV
7. $\mathrm{P}=$ supply +6 V
8. $\mathrm{N}_{1}=$ supply -6 V
9. $W_{1}=$ d.c. input 1
10. $\mathrm{Q}_{1}=$ output 1

## OS2 - ONE-SHOT MULTIVIBRATOR

When a positive-going voltage step is applied to terminal A of this monostable multivibrator the circuit generates a pulse at the Q-terminals. The duration of the output pulse is determined by the value of: the external capacitance $C$ between $K$ and $L$ (for pulses longer than the intrinsic value); the external resistance between $Q_{1}$ and $W$ (for pulses shorter than the intrinsic value).

Type number: B8950 03
Colour: green

Terminals:

1. $\mathrm{Q}_{1}=$ output 1
2. $\mathrm{Q}_{2}=$ output 2
3. $W=$ d.c. input
4. $\mathrm{K}=$ for external capacitor
5. not connected
6. $\mathrm{L}=$ for external capacitor
7. $\mathrm{A}=$ trigger input
8. $\mathrm{N}=$ supply -6 V
9. $\mathrm{P}=$ supply +6 V
10. $\mathrm{E}=$ common supply OV

## CIRCUIT BLOCKS - 100 series

## UNITS WITH A SIGNAL-GENERATING AND PULSE-SHAPING FUNCTION

PULSE SHAPER - PS1

## Type number: B8 95000

Colour: green
A d.c. input signal of a magnitude exceeding the input tripping level of this squaring amplifier and inverter circuit, is re-shaped and inverted into the standard d.c. level at the output. The output voltage transients are very short and can be used for driving other circuit blocks, multivibrator circuits included.

Terminals:

1. $\mathrm{Q}=$ output
2. internally connected
3. internally connected

4. $\mathrm{P}=$ supply +6 V
5. $W=$ input
6. not connected
7. $\mathrm{E}=$ common supply 0 V
8. not connected
9. internally connected
10. $\mathrm{N}=$ supply -6 V

Type number: B8 95004
Colour: green
The unit is mainly designed to operate as a clock source, delivering trigger pulses for a great number of flip-flops FF1, FF2, FF3 and FF4 or as a counter driver.

Terminals:

1. $\mathrm{A}=$ trigger input
2. $G=$ gate input
3. $\mathrm{K}=$ for external capacitor
4. $W=$ d.c. input
5. $\mathrm{EG}=$ extension gate input

6. $\mathrm{L}=$ for external capacitor
7. $\mathrm{Q}=$ output
8. $\mathrm{N}=$ supply -6 V
9. $\mathrm{P}=$ supply +6 V
10. $\mathrm{E}=$ common supply 0 V

## UNITS WITH A GATE FUNCTION

## TWIN GATES

### 2.3N1 - THREE NEGATIVE INPUTS

Terminals:

1. $\mathrm{N}_{1}=$ supply -6 V
2. $W_{1}=$ input 1
3. $W_{3}=$ input 3
4. $W_{5}=$ input 5
5. $\mathrm{Q}_{1}=$ output 1
6. $\mathrm{Q}_{2}=$ output 2
7. $\mathrm{W}_{2}=$ input 2
8. $W_{4}=$ input 4
9. $\mathrm{W}_{6}=$ input 6
10. $\mathrm{N}_{2}$ = supply -6 V

### 2.2N1 - TWO NEGATIVE INPUTS

Type number: B8 93001
Colour: orange

The two gates of circuit blocks 2.3 N 1 and 2.2 N 1 are identical.
They can be used separately, or in combination by interconnecting the output terminals $\mathrm{Q}_{1}$ and $\mathrm{Q}_{2}$. In this latter case only one negative-supply terminal should be used.

Type number:
B8 93000
Colour: orange

Terminals:

1. $\mathrm{N}_{1}=$ supply -6 V
2. $W_{1}=$ input 1
3. $W_{3}=$ input 3
4. not connected
5. $\mathrm{Q}_{1}=$ output 1
6. $\mathrm{Q}_{2}=$ output 2
7. not connected
8. $W_{2}=$ input 2
9. $W_{4}=$ input 4
10. $\mathrm{N}_{2}=$ supply -6 V

### 2.3P1 - THREE POSITIVE INPUTS

Terminals:

1. $\mathrm{P}_{1}=$ supply +6 V
2. $\mathrm{W}_{1}=$ input 1
3. $W_{3}=$ input 3
4. $W_{5}=$ input 5
5. $\mathrm{Q}_{1}=$ output 1
6. $\mathrm{Q}_{2}=$ output 2
7. $\mathrm{W}_{2}=$ input 2

Type number:
B8 93002
Colour: orange
7.

The two gates of circuit blocks 2.3 P 1 and 2.2 P 1 are identical.
They can be used separately, or in combination by interconnecting the output terminals $\mathrm{Q}_{1}$ and $\mathrm{Q}_{2}$. In this latter case only one positive-supply terminal should be used.

### 2.2P1 - TWO POSITIVE INPUTS

Terminals:

1. $P_{1}=$ supply +6 V
2. $\mathrm{W}_{1}=$ input 1
3. $W_{3}=$ input 3
4. not connected
5. $\mathrm{Q}_{1}=$ output $1 \quad$ 8. $W_{4}=$ input 2
6. $\mathrm{Q}_{2}=$ output 2
7. not connected

Type number:
B8 93003
Colour: orange
9. $W_{6}=$ input 4
10. $\mathrm{P}_{2}=$ supply +6 V

## Type number: B8 93004

Colour: orange
The circuits are normally used in conjunction with flip-flop circuits. With the twin pulse logic a second pair of a.c. inputs is formed for a flip-flop type FF1, or in combination with flip-flops type FF2 a bi-directional shift register can be made. The twin pulse logic output terminals are to be connected directly to the flip-flop d.c. input terminals for this application.

Terminals

1. $G_{1}=$ gate input 1
2. $\mathrm{V}_{2}=$ reset input 2
3. $\mathrm{A}_{1}=$ a.c. input 1
4. $\mathrm{A}_{2}=$ a.c. input 2
5. $\mathrm{Q}_{2}=$ output 2
6. $\mathrm{K}_{2}=$ normally not used
7. $K_{1}=$ normally not used
8. $\mathrm{Q}_{1}=$ output 1
9. $\mathrm{V}_{1}=$ reset input 1
10. $\mathrm{G}_{2}=$ gate input 2

## Type number: $\mathbf{3 8} 93007$

Colour: orange
The circuits are normally used in conjunction with flip-flop circuits. With the twin pulse logic a second pair of a.c. inputs is formed for a flip-flop type FF3, or in combination with flip-flops type FF4 a bi-directional shift register can be made. The twin pulse logic output terminals are to be connected directly to the flip-flop d.c. input terminals for this application.

TWIN PULSE LOGIC - 2PL1

TWIN PULSE LOGIC-2PL2

## Terminals

1. $\mathrm{G}_{1}=$ gate input 1
2. $\mathrm{G}_{2}=$ gate input 2
3. $\mathrm{K}_{1}=$ for external gate input
4. $\mathrm{K}_{2}=$ for external gate input
5. $\mathrm{Q}_{2}=$ output 2
6. $\mathrm{Q}_{1}=$ output 1
7. $\mathrm{A}_{1}=$ trigger input 1
8. $\mathrm{A}_{2}=$ tripper input 2
9. $N=$ supply -6 V
10. not connected

## UNITS WITH AN AMPLIFYING FUNCTION

## 2EF1 - TWIN EMITTER FOLLOWER

Type number: B8940 01
Colour: yellow
The unit B894001 contains two identical transistor emit-ter-follower circuits that perform a non-inverting bufferamplifier function with a low output impedance.
The unit is equipped with a tapping on the output resistor for cases in which a level shift towards the positive supply line is required.

Terminals

1. $\mathrm{Q}_{2}=$ output 2
2. $\mathrm{T}_{2}=$ tap output 2
3. $\mathrm{W}_{2}=$ input 2
4. $\mathrm{P}_{2}=$ supply +6 V (2)
5. $\mathrm{P}_{1}=$ supply +6 V (1)
6. $\mathrm{N}_{2}=$ supply $-6 \mathrm{~V}(2)$
7. $\mathrm{N}_{1}=$ supply -6 V (1)
8. $W_{1}=$ input 1
9. $\mathrm{T}_{1}=$ tap output 1
10. $\mathrm{Q}_{1}=$ output 1

## 2EF2 - TWIN EMITTER FOLLOWER

## Type number: B8 94003

Colour: yellow
The unit B894003 contains two identical EF2 emitterfollower circuits that perform a buffer amplifier function. The unit has been especially designed to amplify the weak output signals originating from a diode gate circuit.
The output signal is normally taken from the Q-terminal. When a flip-flop is to be set or reset by an EF2, normally the diode output R is used, the memory function of the flip-flop then being maintained.

Terminals:

1. $\mathrm{Q}_{2}=$ output 2
2. $\mathrm{M}_{2}=$ clamp diode 2
3. $\mathrm{R}_{2}=$ diode output 2
4. $\mathrm{W}_{2}=$ input 2
5. $\mathrm{P}=$ supply +6 V
6. $\mathrm{W}_{1}=$ input 1
7. $\mathrm{N}=$ supply -6 V
8. $\mathrm{R}_{1}=$ diode output 1
9. $\mathrm{M}_{1}=$ clamp diode 1
10. $\mathrm{Q}_{1}=$ output 1

## UNITS WITH AN AMPLIFYING FUNCTION

Type number: B8940 02
Colour: yellow
The unit contains two identical inverter circuits.
The circuits constitute an inverting (NOT) function when driven by a signal on the input terminal $W$.

Terminals:

1. $\mathrm{Q}_{2}=$ output 2
2. $\mathrm{P}_{1}=$ supply +6 V
3. $\mathrm{W}_{2}=$ input 2
4. $\mathrm{N}_{2}=$ supply -6 V
5. $\mathrm{E}_{2}=$ common supply 0 V
6. $\mathrm{N}_{1}=$ supply -6 V
7. $\mathrm{E}_{1}=$ common supply OV
8. $W_{1}=$ input 1
9. $\mathrm{P}_{1}=$ supply +6 V
10. $\mathrm{Q}_{1}=$ output 1

TWIN INVERTER AMPLIFIER -2IA 1

Type number: B8 94005
Colour: yellow
This unit, which has been specially designed to amplify the weak output signals originating from a diode gate circuit, can also be used as a driver for power stages.

Terminals:

1. $\mathrm{Q}_{2}=$ output 2
2. $\mathrm{Q}_{1}=$ output 1
3. $\mathrm{W}_{2}=$ input 2
4. $W_{1}=$ input 1
5. $\mathrm{N}_{4}=$ supply $-6 \mathrm{~V}^{1}$
6. $\mathrm{N}_{3}=$ supply $-6 \mathrm{~V}^{1}$
7. $\mathrm{N}_{2}=$ supply $-6 \mathrm{~V}^{1}$
8. $\mathrm{N}_{1}=$ supply $-6 \mathrm{~V}^{1}$
9. $\mathrm{P}=$ supply +6 V
10. $\mathrm{E}=$ common supply 0 V
${ }^{1}$ Use dependent on application.

Type number: B8 94000
Colour: yellow

## EMITTER FOLLOWER/INVERTER AMPLIFIER - EF1/IA1

The two circuits, an emitter-follower circuit and an inverter circuit, can be used independently or in combination.

Terminals:

1. $\mathrm{Q}_{2}=$ output 2
2. $\mathrm{E}_{4}=$ common supply 0 V
3. $\mathrm{W}_{2}=$ input 2
4. $\mathrm{P}_{2}=$ supply +6 V
5. $P_{1}=$ supply +6 V
6. $\mathrm{N}_{2}=$ supply -6 V
7. $\mathrm{N}_{1}=$ supply -6 V
8. $W_{1}=$ input 1
9. $\mathrm{T}_{1}=$ tapped output 1
10. $\mathrm{Q}_{1}=$ output 1

TWIN INVERTER AMPLIFIER - 2IA2

Note: EF1 terminals with index 1 ; IA1 terminals with index 2.

## 100 series - CIRCUIT BLOCKS

## UNITS WITH AN AMPLIFYING FUNCTION

## PA1-POWER AMPLIFIER

Type number: B8 90000
Colour: yellow
The amplifier is non-inverting, and can be driven directly by the circuit blocks FF1, FF2, FF3, FF4, OS2, IA1 and IA2. The absolute max. output loadability is 600 mA at -60 V .

Terminals

1. $\mathrm{E}=$ common supply OV
2. $\mathrm{P}=$ supply +6 V
3. $\mathrm{N}_{1}=$ supply -6 V
4. $\mathrm{N}_{2}=$ supply max. -60 V
5. $\mathrm{N}_{2}=$ supply max. -60 V
6. $\mathrm{Q}=$ output

7. $W=$ input

## Mounting instructions

For mounting on the chassis B871609 (page B22) use is made of a metal bracket as indicated in the figure. The PA1 occupies the width of three circuit blocks.

On a standard printed-wiring board, for use in the chassis B871610 (page B22), up to four PA1's can be mounted, the next position in the chassis being left empty.

## STANDARD P.W. BOARD, TYPE P8 90640 FOR 4 PA1'S

For use in the mounting chassis B871610 a standard p.w. board, type number P890640, is available. Its outside dimensions are $121.8 \mathrm{~mm} \times 180.3 \mathrm{~mm} \times 1.6$ $\mathrm{mm}\left(4.8^{\prime \prime} \times 7.1^{\prime \prime} \times 0.0625^{\prime \prime}\right)$. It can be used directly with the aid of the mating connector type F045CC/025.

## CIRCUIT BLOCKS - $\mathbf{1 0 0}$ series

## UNITS WITH A COUNTER AND SHIFT REGISTER FUNCTION

## (1-2-4-2 code - 4xFF1) DECADE COUNTER - DC 1

## Type number: B8 85000

The unit B8 85000 consists of four flip-flops type B8 92000 mounted on a printed-wiring board and connected as a counter, working in the 1-2-4-2 code.
The counter is provided with pulse feed-back to achieve that six of the sixteen possible positions are skipped. The flip-flops can be reset by means of a common positive signal.
The reset diodes $D_{1}, D_{2}, D_{3}, D_{4}$ and the feed-back network $D_{5}, D_{6}, R_{1}$ and $C_{1}$ are mounted on the printed-wiring board.
The printed-wiring board type P8 90559 is provided with plated-through holes, double-sided printedwiring and double-sided gold-plated contacts.
The mating connector type F $042 \mathrm{ZZ} / 03$ is normally not supplied with the counter.

Terminals:

1. $\mathrm{Q}_{2 \mathrm{~B}}=$ output 2 flip-flop B
2. $Q_{2 C}=$ output 2 flip-flop $C$
3. $\mathrm{Q}_{2 \mathrm{D}}=$ output 2 flip-flop D
4. $\mathrm{Q}_{1 \mathrm{D}}=$ output 1 flip-flop D
5. $\mathrm{Q}_{1 \mathrm{~B}}=$ output 1 flip-flop B
6. $\mathrm{Q}_{1 \mathrm{C}}=$ output 1 flip-flop $C$
7. $\mathrm{Q}_{2 \mathrm{~A}}=$ output 2 flip-flop A
8. $\mathrm{A}=$ a.c. input
9. $\mathrm{P}_{2}=$ supply +6 V
10. $\mathrm{E}=$ common supply OV
11. $\mathrm{V}=$ reset input
12. $\mathrm{P}_{1}=$ supply +6 V
13. $\mathrm{N}=$ supply -6 V
14. $\mathrm{Q}_{1 \mathrm{~A}}=$ output 1 flip-flop A

## 100 series - CIRCUIT BLOCKS

## UNITS WITH A COUNTER AND SHIFT REGISTER FUNCTION

## 2DCA2 - TWIN DECADE COUNTER (1-2-4-8 code $\mathbf{- 2 \times 4 \times F F 3 )}$

The unit B885001 contains two identical decade counter units, mounted on a printed-wiring board. Each counter consists of four flip-flops FF3 (type B892002), connected to operate in the 1-2-4-8 code. With the mating connector type F045CC/025, the printed-wiring board of standard dimensions (121.8 $\mathrm{mm} \times 180.3 \mathrm{~mm} \times 1.6 \mathrm{~mm}$ ) can be used directly in the standard mounting chassis, type B871610.

Type number: B8 85001

Terminals:

1. $\mathrm{V}_{1}=$ reset input counter 1
2. $\mathrm{A}_{1}=$ a.c. input counter 1
3. $Q_{2 A}=$ output 2 flip-flop $A$
4. $Q_{2 B}=$ output 2 flip-flop $B$
5. $Q_{2 C}=$ output 2 flip-flop $C$
6. $\mathrm{Q}_{2 \mathrm{D}}=$ output 2 flip-flop D
7. $Q_{1 D}=$ output 1 flip-flop $D$
8. $Q_{1 C}=$ output 1 flip-flop $C$
9. $Q_{1 B}=$ output 1 flip-flop $B$
10. $\mathrm{Q}_{1 \mathrm{~A}}=$ output 1 flip-flop A
11. $\mathrm{Q}_{1 \mathrm{E}}=$ output 1 flip-flop E
12. $\mathrm{Q}_{1 \mathrm{~F}}=$ output 1 flip-flop F
13. $\mathrm{Q}_{1 \mathrm{G}}=$ output 1 flip-flop G
14. $\mathrm{Q}_{1 \mathrm{H}}=$ output 1 flip-flop H
15. $\mathrm{Q}_{2 \mathrm{H}}=$ output 2 flip-flop H
16. $\mathrm{Q}_{2 G}=$ output 2 flip-flop G
17. $\mathrm{Q}_{2 \mathrm{~F}}=$ output 2 flip-flop F
18. $\mathrm{Q}_{2 \mathrm{E}}=$ output 2 flip-flop E
19. $\mathrm{A}_{2}=$ a.c. input counter 2
20. $\mathrm{V}_{2}=$ reset input counter 2
21. $\mathrm{N}=$ common negative supply -6 V
22. $\mathrm{P}=$ common positive supply +6 V
23. $\mathrm{E}=$ common supply OV

## CIRCUIT BLOCKS - $\mathbf{1 0 0}$ series

## UNITS WITH A COUNTER AND SHIFT REGISTER FUNCTION

## ( $5 \times$ FF4 $+5 \times 2$. PL2) REVERSIBLE SHIFT REGISTER OR RING COUNTER - RCA1

## Type number: B8 85002

The unit B885002 consists of five flip-flops FF4 (type B892003) and five twin pulse logics 2PL2 (type B893007), mounted on a printed-wiring board, interconnected to operate as a bi-directional shift register. A bi-directional decade counter can be realized by interconnecting the gate terminals $G$ of the first flip-flop with the output terminals $Q$ of the fifth flip-flop and the gate terminals $G$ of the fifth twin pulse logic with the output terminals $Q$ of the first flip-flop.
With the mating connector type $\mathrm{F} 045 \mathrm{CC} / 025$, not supplied with the reversible counter, this printedwiring board of standard dimensions ( $121.8 \mathrm{~mm} \times 180.3 \mathrm{~mm} \times 1.6 \mathrm{~mm}$ ) can be used directly in the standard mounting chassis type B8 71610.

Terminals:

1. $A_{1}=$ a.c. input forward direction
2. $G_{1}=$ gate input $\left(G_{1}\right)$ flip-flop $A$
3. $G_{2}=$ gate input $\left(G_{2}\right)$ flip-flop $A$
4. $Q_{2 \mathrm{E}}=$ output 2 flip-flop E
5. $\mathrm{Q}_{1 \mathrm{E}}=$ output 1 flip-flop E
6. $\mathrm{Q}_{2 \mathrm{D}}=$ output 2 flip-flop D
7. $Q_{1 D}=$ output 1 flip-flop $D$
8. $Q_{2 C}=$ output 2 flip-flop $C$
9. $\mathrm{Q}_{1 \mathrm{C}}=$ output 1 flip-flop C
10. $\mathrm{Q}_{2 \mathrm{~B}}=$ output 2 flip-flop B
11. $Q_{1 B}=$ output 1 flip-flop $B$
12. $\mathrm{Q}_{2 \mathrm{~A}}=$ output 2 flip-flop A
13. $\mathrm{Q}_{1 \mathrm{~A}}=$ output 1 flip-flop A
14. $G_{3}=$ gate input $\left(G_{1}\right)$ twin pulse logic $E^{\prime}$
15. $\mathrm{G}_{4}=$ gate input $\left(\mathrm{G}_{2}\right)$ twin pulse logic $\mathrm{E}^{\prime}$

16, 17, 18. not connected
19. $A_{2}=$ a.c. input reverse direction
20. $V=$ reset input
21. $\mathrm{N}=$ common negative supply -6 V
22. $\mathrm{P}=$ common positive supply +6 V
23. $\mathrm{E}=$ common supply OV

## 100 series - CIRCUIT BLOCKS

## UNITS WITH A FERRITE-CORE MEMORY DRIVE FUNCTION

## READ AMPLIFIER

This read or sense amplifier, consisting of two circuit blocks of standard dimensions, types RA2A and RA2B, is designed to amplify the signals originating from the sense wire of ferrite-core memories. The input is balanced, so either positive-going or negative-going input signals can be applied. The sensitivity of the RA2A can be adjusted to the signal levels of the memory plane by means of an external resistor. The output of the RA2B can be used directly to set a flip-flop of the $100 \mathrm{kc} / \mathrm{s}$ range on its input terminal $W$.

## RA2A

Type number B8 94007
Colour: yellow
Terminals:

1. $W_{1}=$ input
2. $W_{2}=$ input
3. not connected
4. $\mathrm{W}_{3}=$ for external resistor
5. $\mathrm{K}_{1}=$ to be connected to terminal 5 of RA2B
6. not connected
7. not connected
8. $\mathrm{N}=$ supply -6 V
9. $\mathrm{P}=$ supply +6 V
10. $\mathrm{E}=$ common supply OV

RA2B

Type number B8 94008
Colour: yellow
Terminals:

1. not connected
2. not connected
3. not connected
4. not connected
5. $\mathrm{K}_{2}=$ to be connected to terminal 5 of RA2A
6. $\mathrm{Q}=$ output
7. $\mathrm{S}=$ input STROBE pulse
8. $\mathrm{N}=$ supply -6 V
9. $\mathrm{P}=$ supply +6 V
10. $\mathrm{E}=$ common supply 0 V

## CIRCUIT BLOCKS - 100 series

## UNITS WITH A FERRITE-CORE MEMORY DRIVE FUNCTION

## Type number: B8 94006

READ AMPLIFIER - RA1
Colour: yellow
The unit is designed to amplify the signals originating from the sense wire of a small ferrite-core memory plane equipped with cores type 6B2, FX2423 or equivalent types. The maximum plane size is $16 \times 16$ cores.
The circuit consists of a two-stage amplifier; the first stage is balanced, so that the circuit can deal with either positivegoing or negative-going input signals.
Ambient temperature 0 to $+60^{\circ} \mathrm{C}$.

Terminals:

1. not connected
2. $\mathrm{Q}=$ output
3. $\mathrm{Q}=$ output
4. $A_{1}=$ input
5. $\mathrm{A}_{2}=$ input
6. $\mathrm{N}_{1}=$ supply -6 V
7. $\mathrm{N}_{2}=$ supply -6 V
8. internally connected
9. $\mathrm{P}=$ supply +6 V
10. $\mathrm{E}=$ common supply 0 V

Type number: B8 95002
Colour: green
The unit is designed to operate as a "short-interval" switch for ferrite-core memory operation in combination with other standard circuit blocks. The switching is controlled by an input level change applied to a pre-amplifier stage.

Terminals:

1. $R=$ switch in
2. $K=$ transformer terminal
3. $O=$ transformer terminal
4. $\mathrm{S}=$ switch out
5. $\mathrm{E}=$ common supply 0 V
6. $\mathrm{L}=$ transformer terminal
7. $M=$ transformer terminal
8. $N=$ supply $-6 V$
9. $W=$ d.c. input
10. $\mathrm{A}=$ trigger input

PULSE GENERATOR - PG1

## 100 series - CIRCUIT BLOCKS

## UNITS WITH A FERRITE-CORE MEMORY DRIVE FUNCTION

## SG1 - SELECTION GATE

Type number: B8 93005
Colour: orange
The first five input AND gates which decode the selection register information, if followed by a twin two-input AND gate, can perform the read/write control function. The unit is normally used for ferrite-core memory operation, in combination with other standard circuit blocks.

Terminals:

1. $\mathrm{W}_{1}=$ selection input 1
2. $\mathrm{W}_{2}=$ selection input 2
3. $\mathrm{W}_{3}=$ selection input 3
4. $W_{4}=$ selection input 4
5. $W_{5}=$ selection input 5
6. $\mathrm{L}_{1}=\mathrm{read} / \mathrm{write}$ control input 1
7. $\mathrm{L}_{2}=$ read/write control input 2
8. $\mathrm{N}=$ supply -6 V
9. $\mathrm{Q}_{2}=$ output 2
10. $\mathrm{Q}_{1}=$ output 1

The selection input terminals $W$ are connected to the flip-flop in the Selection Register. Depending on the size of the memory, this connection may be direct or via adequate amplifier stages.

## 2SS1 - TWIN SELECTION SWITCH

Type number: B8 96000
Colour: blue
The unit 2SS1 contains two identical circuits designed to operate as current switches in series with the drive wires of a ferrite-core memory.

Terminals:

1. $W_{1}=$ control input 1
2. $\mathrm{W}_{2}=$ control input 2
3. $\mathrm{N}=$ supply -6 V
4. $\mathrm{L}_{2}=$ current input 2
5. $\mathrm{L}_{1}=$ current input 1
6. $\mathrm{R}_{2}=$ switch 2 in
7. $\mathrm{S}_{1}=$ switch 1 out
8. not connected
9. $\mathrm{S}_{2}=$ switch 2 out
10. $\mathrm{R}_{1}=$ switch 1 in

If not otherwise indicated the $N$ and $P$ terminals of each unit are connected to $V_{n}$ and $V_{p}$ respectively. $\left(\mathrm{V}_{\mathrm{n}}=-6 \mathrm{~V} \pm 5 \%, \mathrm{~V}_{\mathrm{p}}=+6 \mathrm{~V} \pm 5 \% ; \mathrm{V}_{\mathrm{n}} / \mathrm{V}_{\mathrm{p}}= \pm 5 \%\right.$ ).

a) IA2 with only terminals N 1 or N 2 connected to $\mathrm{V}_{\mathrm{N}}$.
b) OS1 Q1 output only.
c) ASY27 common emitter stage with $1 \mathrm{k} \Omega$ collector resistor.
d) OS2 Q1 output only.
e) OS2 Q2 output only.

Note: A driving unit $\mathrm{N}_{1}$ preceded by an FF1 or an OS1, can drive up to 2 units OS2.
A driving unit $N_{1}$ preceded by an FF2, can drive 1 unit OS1 maximum.

P1. Unless specified otherwise a P1 may be inserted between two units without great influence upon the loadability. AC inputs of FF1, FF2, FF3, FF4, OS1 and OS2 cannot be driven from it.
2PL1. The 2PL1 is normally used in conjunction with FF1 or FF2. In this case the input data are equivalent to those of the similar FF2 inputs. The output terminals are directly connected to the d.c. input terminals of the FF1 or FF2.

2PL2. Ditto for FF3 and FF4.

1. Each via a $4.7 \mathrm{k} \Omega \pm 5 \%$ resistor in series with a separating diode OA 200, anode to driven unit.
2. Each via a $12 \mathrm{k} \Omega \pm 5 \%$ resistor, bypassed by a 330 pF capacitor.
3. Only if the chain of units indicated is driven by an FF1, FF2, FF3, FF4, PS1 or by terminal Q1 of an OS1 or OS2.
4. The maximum speed of operation is $30 \mathrm{kc} / \mathrm{s}$
number of units driven by the N1 gate
5. Via a diode OA200, cathode to N1, anode to IA2, and bypassed by a 1500 pF capacitor.
6. Via a separating diode OA85, cathode to driven unit.
7. Only if the $N$-terminals of the driving unit are floating.
8. The P-terminal of the P1 gate floating.
9. Total number for both Q -outputs together.
10. Total number per Q -output.
11. Up to 100 only with a $390 \Omega \pm 5 \%$ resistor between the terminals $Q$ and $N$.
12. For each stage of IA1 connect $2,7 \mathrm{k} \Omega \pm 5 \%$ between Q and N of PA1 up to 25 ; min. resistance between $Q$ and N $100 \Omega$ worst case.

## 100 series - CIRCUIT BLOCKS

## MOUNTING AIDS AND ACCESSORIES FOR THE 100 SERIES

## Mounting chassis

Two standardized types of chassis for the mounting of circuit blocks are available, both designed to be fitted in 19" racks.
The chassis of Fig. 1 can contain up to 24 standard printed-wiring boards (see Figs 3, 4, 5, 6 and 7) together with their mating connectors type F045CC/025 (for single-sided contacts) and F045DC/025 (for double-sided contacts), and can be mounted directly in a $19^{\prime \prime}$ rack.

## Type number: B871610

Chassis for circuit blocks mounted on printed-wiring boards

Type number: B871609
Chassis for circuit blocks mounted side by side

The chassis of Fig. 2 can contain up to 19 circuit blocks mounted side by side.
A number of these chassis can be mounted in a metal frame. Fitted in a standard $19^{\prime \prime}$ rack, six of these chassis can be mounted side by side.

## CIRCUIT BLOCKS - $\mathbf{1 0 0}$ series

## PRINTED-WIRING BOARDS FOR THE 100 SERIES

Three types of printed-wiring boards are available for use in the chassis B8 71610 (Fig. 1) all with the same outside dimensions as indicated in the Figs $3,4,5$, and 6. The thickness of these boards is 1.6 mm , and they are provided with 23 single-sided gold-plated contacts. The lay-out of these boards is in accordance with the I.E.C. standard grid of $2.54 \mathrm{~mm}\left(0.1^{\prime \prime}\right)$.
Two larger types of experimenters' printed-wiring boards are available, both with 38 gold-plated contacts at the short sides of the board: type P890079 with single-sided, and type P890089 with doublesided contacts. Both are provided with the same copper pattern as the board illustrated in Fig. 3.

| description | outside dimensions | figure | type number |
| :---: | :---: | :---: | :---: |

## STANDARD MASTER DRAWING SHEET

To facilitate the design of printed-wiring boards with a non-standard pattern for use in the chassis of type B871610, drawing sheets can be supplied on which the soldering pads, the plug-in contacts and some reference points are pre-printed (scale $2: 1$ ). They are made of special material that is dimensionally stable. The type number of this drawing sheet is P8 90156.

LOCKING TAG

Circuit blocks mounted parallel to printedwiring boards can be secured rigidly by means of a small tag, type number B8 43158 , which permits soldering in a standard 1.3 mm hole.

STICKERS 100 SERIES

For quick setting-up of master drawings on transparent tracing material as used e.g. for dye-line printing, a series of self-adhesive stickers with circuit-block symbols, as given in the relevant data sheets, is available. The stickers are delivered on rolls of 1000 pieces per type. Type numbers can be taken from the table given below.

| circuit block | sticker type number | circuit block | sticker type number | circuit block | sticker type number |

## 10 series - CIRCUIT BLOCKS

## STANDARD UNITS FOR LOW SPEED (frequency $\mathbf{3 0 - 7 0} \mathbf{k c} / \mathrm{s}$ )

These highly compact units have been designed for low speed applications; the maximum clock frequency for triggered logic applications is $30 \mathrm{kc} / \mathrm{s}$. Operation in a d.c. logic mode of various units up to a frequency of $65 \mathrm{kc} / \mathrm{s}$ is possible.

This range of circuit blocks is a logical extension to the existing range for medium-speed applications. It combines the general advantages of the approved circuit block conception with the following specific features:
high circuit density; combination of different circuits in one unit, e.g. gates and inverters; ease of application by extremely simple loading rules; increased versatility and improved mutual loadability; consequently possibilities of designing more compact equipment; high switching level; high built-in thresholds against electrical interference; wide storage temperature range.
This range of units is designed as part of a complete system, also comprising the new high-frequency 20 -series (see page B45).

Dimensions: The units are available in two standard cases, dimensions of which are given in the drawing.

## 10 series - CIRCUIT BLOCKS

## UNITS WITH A NAND AND NOR FUNCTION

## 2.GI10 - TWIN GATE INVERTER AMPLIFIER

## Type number: 2 P 73709

Colour insulating sleeve: yellow
The unit contains a single input and a double input positive diode gate-inverter combination, together with one separate diode which can be used to extend the number of gate inputs $G$ on either of the two circuits at the extension gate inputs EG.
The collectors $Q$ of the two transistors are not connected with their corresponding collector resistors R. Therefore with the two transistors a logical operation can be performed by interconnecting the two collectors Q with one collector resistor $R$. The second collector resistor $R$ must be left disconnected.

## 2.GI11 - TWIN GATE INVERTER AMPLIFIER

## Type number: 2 P 73717

Colour insulating sleeve: yellow
The unit contains a single input and a triple input positive diode gate-inverter combination, together with two separate diodes which can be used to extend the number of gate inputs $G$ on either of the two circuits at the extension gate inputs EG.
The collectors Q of the two transistors are not connected with their corresponding collector resistor R. Therefore with the two transistors a logical operation can be performed by interconnecting the two collectors Q with one collector resistor $R$. The second collector resistor $R$ must be left disconnected.

## UNITS WITH A NAND AND NOR FUNCTION

## TWIN GATE INVERTER AMPLIFIER - $2 . \mathrm{GI12}$

Type number: 2 P 73710
Colour insulating sleeve: yellow
The unit contains a double input and a quadruple input positive diode gate-inverter combination, together with two separate diodes which can be used to extend the number of gate inputs $G$ on either of the two circuits at the extension gate inputs $E G$.
The collectors Q of the two transistors are not connected with their corresponding collector resistors R. Therefore with the two transistors a logical operation can be performed by interconnecting the two collectors Q with one collector resistor $R$. The second collector resistor $R$ must be left disconnected.

## NON-INVERTING GATE AMPLIFIER-GA11

## Type number: 2 P 74829

Colour insulating sleeve: yellow
The unit contains a gate circuit and a two-stage non-inverting amplifier. The gain is appreciable and the output of $70 \mathrm{~mA}, 20 \mathrm{~V}$ is sufficient to drive a relay. Three gate resistors are provided for a one- and a two-level gate input, allowing AND operation in a one-stage, AND-AND or AND-OR operation in a two-stage logic.

## 10 series - CIRCUIT BLOCKS

## UNITS WITH A MEMORY FUNCTION

## FF10 - FLIP-FLOP

Type number: 2P 73701
Colour insulating sleeve: red

The unit comprises a set/reset bistable multivibrator circuit. The number of set/reset inputs $S$ can be extended with the aid of external diodes at the extension inputs ES.
The circuit constitutes a memory function, driven by means of a d.c. level at the set/reset inputs $S$. In conjunction with the twin trigger gates 2TG13, 2TG14 or the quadruple trigger gate 4TG15 an a.c. -driven (triggered) flip-flop can be formed, normally used in binary counters and shift registers.
In these applications the output terminals $Q$ of the trigger gates are connected to the input terminals $W$ of the flip-flop.

Terminals:

1. not connected
2. $\mathrm{ES}=$ extension set/reset input
3. not connected
4. $W=$ extension trigger gate
5. not connected

## UNITS WITH A MEMORY FUNCTION

FLIP-FLOP - FF11

Type number: 2P 73702
Colour insulating sleeve: red
The unit contains a set/reset bistable multivibrator circuit with built-in trigger gates. The number of gate inputs $G$ and trigger inputs $T$ can be extended with the aid of external diodes at the extension inputs EG or ET.
The circuit performs a memory function when driven by means of a d.c. level at the extension set/reset input ES or a negative-going trigger signal at the trigger inputs $T$. In the case of trigger drive, the switching of the flip-flop can be controlled by a d.c. level applied to the built-in gate inputs $G$ (e.g. in shift registers), whilst the trigger inputs $T$ are interconnected. It can also be used as a divider, when the gate inputs $G$ are connected to the corresponding outputs Q . With the aid of trigger gates 2 TG13, 2TG14 or the quadruple trigger gate 4TG15, extra triggering facilities can be made by connecting their outputs $Q$ to the trigger gate inputs $W$ of the flip-flop (e.g. in bi-directional shift registers and counters).

Terminals:

1. $E G=$ extenstion gate input
2. $E S=$ extension set/reset input
3. $\mathrm{ET}=$ extension trigger input
4. $\mathrm{W}=$ extension trigger gate
5. $G=$ gate input
6. $\mathrm{Q}=$ output
7. $\mathrm{T}=$ trigger input
8. not connected
9. $\mathrm{N}=$ supply -12 V
10. $\mathrm{E}=$ common supply 0 V
11. $E G=$ extension gate input
12. $\mathrm{ES}=$ extension set/reset input
13. $\mathrm{ET}=$ extension trigger input
14. $W=$ extension trigger gate
15. $\mathrm{G}=$ gate input
16. $\mathrm{Q}=$ output
17. $\mathrm{T}=$ trigger input
18. not connected
19. $\mathrm{P}=$ supply +12 V

## 10 series - CIRCUIT BLOCKS

## UNITS WITH A MEMORY FUNCTION

## FF12 - FLIP-FLOP

## Type number: 2P 73703

Colour insulating sleeve: red
The unit comprises a set/reset bistable multivibrator circuit with built-in trigger gates. The number of set/reset inputs $S$, gate inputs $G$ and trigger inputs $T$ can be extended with the aid of external diodes at the extension inputs ES, EG or ET. The circuit constitutes a memory function when driven by means of a doc. level at the set/reset inputs $S$ or a negative-going trigger signal at the trigger inputs T . In the case of trigger drive, the switching of the flip-flop can be controlled by a d.c. level applied to the built-in gate inputs $G$ (egg. in shift registers), whilst the trigger inputs T are interconnected. It can also be used as a binary divider, when the gate inputs G are connected to the corresponding outputs Q .
With the aid of trigger gates 2TG13, 2TG14 or the quadruple trigger gate 4TG15, extra triggering facilities can be made by connecting their outputs $Q$ to the corresponding trigger gate inputs $W$ of the flip-flop (e.g. in bi-directional shift registers and counters).

Terminals

1. $\mathrm{EG}=$ extension gate input
2. $\mathrm{ES}=$ extension set/reset input
3. $\mathrm{ET}=$ extension trigger input
4. $W=$ extension trigger gate
5. $\mathrm{G}=$ gate input
6. $\mathrm{Q}=$ output
7. $\mathrm{T}=$ trigger input
8. $\mathrm{S}=$ set/reset input

15. $G=$ gate input
16. $\mathrm{Q}=$ output
17. $\mathrm{T}=$ trigger input
18. $\mathrm{S}=$ set/reset input
19. $\mathrm{P}=$ supply +12 V

## UNITS WITH A PULSE GATING FUNCTION

TWIN TRIGGER GATE - 2TG13

## Type number: 2P 73718

Colour insulating sleeve: orange
The unit comprises two identical trigger gate circuits, which are normally used in conjunction with flip-flop units FF10, FF11, or FF12.
With the twin trigger gate a second pair of trigger inputs is formed for the flip-flops FF11 or FF12, to make one stage of a bi-directional counter or shift register. In these applications the output terminals $G$ of the 2TG13 are to be connected directly to the input terminals $W$ of the flip-flop. The trigger gates are controlled by a d.c. voltage level, applied to the input terminals $G$.
The number of gate inputs $G$ or trigger inputs $T$ can be extended with the aid of external diodes at the extension inputs EG or ET.

Terminals:

1. $\mathrm{EG}=$ extension gate input
2. not connected
3. $\mathrm{ET}=$ extension trigger input
4. $\mathrm{Q}=$ output
5. $G=$ gate input
6. not connected
7. $\mathrm{T}=$ trigger input

16. not connected
17. $T=$ trigger input
18. not connected
19. $\mathrm{P}=$ supply +12 V

## 10 series - CIRCUIT BLOCKS

## UNITS WITH A PULSE GATING FUNCTION

## 2TG14 - TWIN TRIGGER GATE

Type number: 2P 73719
Colour insulating sleeve: orange
The unit comprises two identical trigger gate circuits, which are normally used in conjunction with flip-flop units FF10, FF11, or FF12.
With the twin trigger gate a second pair of trigger inputs is formed for the flip-flops FF11 or FF12, to make one stage of a bi-directional counter or shift register. In these applications the output terminals $Q$ of the 2 TG14 are to be connected directly to the input terminals $W$ of the flip-flop.
The trigger gates are controlled by a d.c. voltage level applied to the input terminals $G$.
Two separate built-in diodes can be used to extend the number of gate inputs $G$ at the extension inputs EG

Terminals:

1. $E G=$ extension gate input
2. $\mathrm{D}=$ anode separate diode
3. $\mathrm{ET}=$ extension trigger input
4. $\mathrm{Q}=$ output
5. $G=$ gate input
6. $\mathrm{C}=$ cathode separate diode
7. $\mathrm{T}=$ trigger input
8. not connected
9. $\mathrm{N}=$ supply -12 V
10. $\mathrm{E}=$ common supply OV
11. $\mathrm{EG}=$ extension gate input
12. $\mathrm{D}=$ anode separate diode
13. $\mathrm{ET}=$ extension trigger input
14. $\mathrm{Q}=$ output
15. $G=$ gate input
16. $C=$ cathode separate diode
17. $\mathrm{T}=$ trigger input
18. not connected
19. $\mathrm{P}=$ supply +12 V

## UNITS WITH A PULSE GATING FUNCTION

QUADRUPLE TRIGGER GATE - 4TG15

Type number: 2P 74818
Colour insulating sleeve: orange
The unit comprises four separate identical trigger gate circuits, which are normally used in conjunction with flip-flop units FF10, FF11, or FF12.
By connecting the output terminals Q of the 4TG15 directly to the appropriate input terminals $W$ of a flip-flop FF 10 , one stage of a bi-directional counter or bi-directional shift register is formed. When, however, the output terminals Q of one 4 TG 15 are connected to the appropriate input terminals $W$ of two units FF11 or FF12, two stages of a bi-directional counter or bi-directional shift registerare formed. The trigger gates are controlled by a d.c. voltage level, applied to the input terminals $G$.
The number of gate inputs $G$ can be extended with the aid of external diodes at the extension inputs EG.

Terminals:

1. $E G_{1}=$ extension gate input
2. $\mathrm{EG}_{2}=$ extension gate input
3. $\mathrm{T}_{1}=$ trigger input
4. $\mathrm{Q}_{1}=$ output
5. $\mathrm{Q}_{2}=$ output
6. $\mathrm{G}_{1}=$ gate input
7. $G_{2}=$ gate input
8. $\mathrm{T}_{3}=$ trigger input
9. $\mathrm{N}=$ supply -12 V
10. $\mathrm{E}=$ common supply OV
11. $E G_{3}=$ extension gate input
12. $\mathrm{EG}_{4}=$ extension gate input
13. $\mathrm{T}_{2}=$ trigger input
14. $\mathrm{Q}_{3}=$ output
15. $\mathrm{Q}_{4}=$ output
16. $\mathrm{G}_{3}=$ gate input
17. $G_{4}=$ gate input
18. $\mathrm{T}_{4}=$ trigger input
19. $\mathrm{P}=$ supply +12 V

## 10 series - CIRCUIT BLOCKS

## UNITS WITH A PULSE GENERATING AND PULSE SHAPING FUNCTION

## OS10 - ONE-SHOT MULTIVIBRATOR

Type number: 2P 73705
Colour insulating sleeve: green
The unit OS 10 contains a monostable multivibrator circuit with a built-in trigger gate.
The trigger gate can be controlled by a d.c. voltage level applied via a diode to terminal EG. The number of trigger inputs T can be extended with the aid of external diodes at the extension input ET.
When a negative-going voltage step is applied to terminal $T$, the circuit generates a pulse at the output terminals Q , provided the gate is open. The duration of the output pulse can be increased by an external capacitor to be connected between the terminals $\mathrm{EC}_{1}$ and $\mathrm{EC}_{2}$. Output pulse duration $4 \mu \mathrm{sec}$ to 30 msec .

Terminals:

1. $\mathrm{EG}=$ extension gate input
2. not connected
3. $\mathrm{ET}=$ extension trigger input
4. not connected
5. not connected
6. $\mathrm{Q}_{1}=$ output 1
7. $\mathrm{T}=$ trigger input
8. not connected
9. $\mathrm{N}=$ supply -12 V

11. $E C_{2}=$ for external capacitor
12. not connected
13. not connected
14. not connected
15. not connected
16. $\mathrm{Q}_{2}=$ output 2
17. $\mathrm{EC}_{1}=$ for external capacitor
18. not connected
19. $\mathrm{P}=$ supply +12 V

TIMER UNIT - TU10

Type number: 2P 73706
Colour insulating sleeve: green
The unit TU10 contains a timing circuit followed by a Schmitt trigger circuit and an inverting amplifier. It also comprises a built-in trigger gate. The trigger gate can be controlled by a d.c. voltage level applied via a diode to terminal EG. The number of trigger inputs T can be extended with the aid of external dicdes at the extension input ET.
When a negative-going voltage step is applied to terminal T , the circuit generates a positive-going pulse at the output terminal Q , provided the gate is open. The duration of the output pulse is determined by the value of the external capacitor to be connected between the terminals $\mathrm{EC}_{1}$ and $\mathrm{EC}_{2}$ and of the external resistor between the terminals $E R$ and $P$. Output pulse duration max. 60 sec .

## Terminals:

1. $E G=$ extension gate input
2. not connected
3. $\mathrm{ET}=$ extension trigger input
4. not connected
5. not connected
6. not connected
7. $T=$ trigger input

12. not connected
13. not connected
14. not connected
15. $E R=$ for external resistor
16. $\mathrm{Q}=$ output
17. $E C_{2}=$ for external capacitor ( + terminal)
18. $P=$ supply +12 V (internally connected to terminal 19)
19. $\mathrm{P}=$ supply +12 V

## 10 series - CIRCUIT BLOCKS

## UNITS WITH A PULSE GENERATING AND PULSE SHAPING FUNCTION

PD10 - PULSE DRIVER

Type number: 2P 73714
Colour insulating sleeve: green
The unit PD10 contains a monostable multivibrator circuit with a built-in trigger gate.
The trigger gate can be controlled by a d.c. voltage level applied via a diode to terminal EG. The number of trigger inputs $T$ can be extended with aid of external diodes at the extension input ET.
When a negative-going voltage step is applied to terminal $T$, the circuit generates a pulse at the output terminal Q , provided the gate is open.
The duration of the output pulse can be increased (max. 5 msec .) by an external capacitor to be connected between the terminals $\mathrm{EC}_{1}$ and $\mathrm{EC}_{2}$.
The unit is well suited as clock or reset source by virtue of its considerable output power.

Terminals:

1. $E G=$ extension gate input
2. not connected
3. $\mathrm{ET}=$ extension trigger input
4. not connected
5. not connected
6. $\mathrm{Q}=$ output
7. $\mathrm{T}=$ trigger input

12. not connected
13. not connected
14. not connected
15. not connected
16. not connected
17. $\mathrm{EC}_{2}=$ for external capacitor
18. not connected
19. $\mathrm{P}=$ supply +12 V

## UNITS WITH A PULSE GENERATING AND PULSE SHAPING FUNCTION

Type number: 2P 737 13/10
Colour insulating sleeve: green
The unit PS10 contains a Schmitt trigger (squaring) circuit followed by an inverting amplifier.
An input signal of a magnitude exceeding the tripping level of the unit is reshaped and inverted into the standard d.c. level at the output. The output voltage transients are short and suitable for driving the multivibrator circuits at their trigger inputs $T$.
The input terminals $A$ and $B$ are provided in order to be able to use the PS10 for the following purposes:

1. as a pulse shaper, driven by an external source;
2. as a relaxation oscillator circuit;
3. as a pulse shaper, driven by circuit blocks of the 10 -series.

Terminals:

1. $\mathrm{A}=$ resistor input (interconnected to terminal 17)
2. $\mathrm{B}=$ direct base input
3. not connected
4. $\mathrm{E}=$ common supply $0 V$ (interconnected to terminal 10)
5. not connected
6. $\mathrm{Q}=$ output
7. not connected
8. not connected
9. $\mathrm{N}=$ supply -12 V
10. $\mathrm{E}=$ common supply 0 V (interconnected to terminal 4)
11. internally connected

14. internally connected
15. not connected
16. not connected
17. $\mathrm{A}=$ resistor input (interconnected to terminal 1 )
18. $\mathrm{P}=$ supply +12 V
19. $P=$ supply +12 V

Terminals 18 and 19 interconnected

## 10 series - CIRCUIT BLOCKS

## UNITS WITH AN OUTPUT FUNCTION

## RD10 - RELAY DRIVER

## Type number: 2 P 73716

Colour insulating sleeve: blue
The unit comprises a single input positive diode gate followed by a non-inverting amplifier, intended for driving relays. The number of gate inputs $G$ can be extended by means of external diodes to be connected to the extension gate input EG. The absolute max. output loadability is $2 \mathrm{~A},-55 \mathrm{~V}$.

8. $\mathrm{N}_{2}=$ supply abs. max. 55 V
9. $\mathrm{N}_{2}{ }^{\prime}=$ supply abs. max. 55 V
10. $\mathrm{Q}=$ output

Type number: 2P 73707
The PA10 consists of a transistor amplifier circuit, designed to be used as a power amplifier with max. loadability of $2 \mathrm{~A},-55.5 \mathrm{~V}$. The amplifier can be driven directly by the circuit blocks FF10, FF11, FF12, 2Gl10, 2Gl11, 2Gl12, OS10, PD10, PS10, GA11 and TU10.

## CIRCUIT BLOCKS - 10 series

## UNITS WITH AN OUTPUT FUNCTION

Printed-wiring board for PA10
Type number: 2P 17510

POWER AMPLIFIER - PA10
Mechanical construction

For use in the mounting chassis B871611, a glass-epoxy standard printed wiring board, 2P 17510 is available. Its outside dimensions are $121.8 \mathrm{~mm} \times 180.3 \mathrm{~mm} \times 1.6 \mathrm{~mm}$ $\left(4.8^{\prime \prime} \times 7.1^{\prime \prime} \times 0.0625^{\prime \prime}\right)$ and it can be used directly with the aid of the mating connector, with double-sided contacts type F $045 \mathrm{DC} / 025$.
On this standard printed-wiring board up to four PA10's can be mounted, the next position in the chassis being left empty.

## Loading rules

1. Verify that the sum of the required d.c. input currents of the driven units does not exceed the available d.c. output current of the driving unit.
2. When, however, T-inputs are incorporated in the driven units, the transient charges must also be verified.
3. Only driven units of which all inputs are high, do load the driving stage during the negative-going transient.
4. The wiring capacitance consumes an extra charge of $0.007 \mathrm{nC} / \mathrm{pF}$.
5. T-inputs of closed gates do not require any current or charge.
6. The verifications mentioned above hold for operations at the worst combination of supply voltage tolerance ( $12 \mathrm{~V} \pm 5 \%$ ) and ambient temperature, between 0 and $+55^{\circ} \mathrm{C}$. For temperatures below $0^{\circ} \mathrm{C}$, derating data are given in the data sheet.

## MOUNTING AIDS AND ACCESSORIES FOR THE 10 SERIES

## Mounting chassis type number B8 71611

This standardised type of chassis for assembling circuit blocks mounted on printed-wiring boards is designed to be fitted in 19 inch racks.
The chassis shown in Fig 1 can contain up to 21 standard printed-wiring boards with outside dimensions of $121.8 \mathrm{~mm} \times 180.3 \mathrm{~mm} \times 1.6 \mathrm{~mm}\left(4.8^{\prime \prime} \times 7.1^{\prime \prime} \times 0.0625^{\prime \prime}\right)$. Together with the printed-wiring boards and their mating connectors type F $045 \mathrm{CC} / 025$ (for single-sided contacts) or F $045 \mathrm{DC/025}$ (for double-sided contacts) it can be mounted directly in a 19 inch rack.

Fig. 1

## Experimenters' printed-wiring board

For mounting in the chassis B8 71611 an experimenters' printed-wiring board is available, provisional type number PRR 23-3-556. It is a board with plated-through holes, to be used with the mating connector F 045 DC/025. The outside dimensions are $121.8 \times 200.6 \times 1.6 \mathrm{~mm},\left(4.8^{\prime \prime} \times 7.9^{\prime \prime} \times 0.0625^{\prime \prime}\right)$ and they are provided with $2 \times 23$ gold-plated contacts. The lay-out is in accordance with the I.E.C. standard grid of $2.54 \mathrm{~mm}\left(0.1^{\prime \prime}\right)$.
The print pattern on both sides of the board, shown in Figs 2 and 3, is chosen in such a way that it is applicable for horizontal as well as vertical mounting of the circuit blocks on the board.
The boards are provided with two marks to indicate the place at which they should be cut off, to obtain the standard length of 180.3 mm ( $7.1^{\prime \prime}$ ).

## CIRCUIT BLOCKS - 10 series

MOUNTING AIDS AND ACCESSORIES FOR THE 10 series

Fig. 2

## Locking caps

For better securing circuit blocks mounted parallel to a printedwiring board (horizontal mounting), window-shaped locking caps (Fig 4), type number 4322026 32151, are available. They fit the top of a circuit block.
The locking caps are provided with two holes and recesses to lodge two soldering tags, with which the caps can be secured to the board.
The soldering tags, type number 4322026 32141, have to be ordered separately.

## Standard master drawing sheet

To facilitate the design of printed-wiring boards with a non-standard pattern for use in the chassis type B871611, drawing sheets can be supplied on which the soldering pads, the plug-in contacts and some reference points are preprinted (scale 2:1). They are made of material that is dimensionally stable. The type number of this drawing sheet is P8 90156.

Fig. 4

## Stickers

For quick setting-up of master drawings on transparent tracing material, as used e.g. for dyeline printing, a series of self-adhesive stickers provided with circuit block symbols, as given in the indivi-
 dual data sheets, is available.
The stickers are delivered on rolls of 1000 pieces per type. The type numbers can be found in the table below.

| circuit <br> block | sticker <br> type number | circuit <br> block | sticker <br> type number | circuit <br> block | sticker <br> type number |

## CIRCUIT BLOCKS - 20 series

## STANDARD UNITS FOR HIGH-SPEED APPLICATIONS (frequency $1.1 \mathrm{Mc} / \mathrm{s}$ )

This new series of circuit blocks, the 20 -series, forms part of the same system as the 10 -series and is based upon the same technology.
This series is intended for high-speed applications: The maximum clock-frequency for triggered logic applications is up to $4 \mathrm{Mc} / \mathrm{s}$. Operation in a d.c. logic mode is possible up to a frequency of approx. $2.5 \mathrm{Mc} / \mathrm{s}$.
In these highly compact units use is made of double-diffused silicon planar epitaxial transistors. The blocks have a hermetically sealed metal can; the terminals are brought out via glass compression seals.

## The units FF22 and PD20 are under development.

## 20 series - CIRCUIT BLOCKS

UNITS WITH A GATE INVERTER FUNCTION

## 2.GI20 - TWIN GATE INVERTER

Type number: 2P 73723
Colour insulating sleeve: yellow
The unit contains a single input and a double input diode gate-inverter combination. The separate diode can be used to increase the numbers of gate inputs of either of the two circuits at the extension gate inputs EG.
Together with the inputs $G$ they form an AND function on the positive level. The desired output Q is to be connected to its collector resistor R . A logic function can be obtained by connecting several outputs $Q$ to one common resistor $R$.

Terminals

1. $G_{1}=$ gate input
2. $G_{3}=$ gate input
3. not connected
4. not connected
5. $\mathrm{EG}_{1}=$ extension gate input
6. $\mathrm{Q}=$ output

## 20 series - CIRCUIT BLOCKS

## UNITS WITH A GATE INVERTER FUNCTION

## 2.GI22 - TWIN GATE INVERTER

Type number: 2P 73729
Colour of insulating sleeve: yellow
The unit contains two gate inverters with a high loadability. The separate diode can be used to increase the number of gate inputs of either of the two circuits at the extension gate inputs EG.
Together with the inputs $G$ they form an AND function on the positive level. The desired output $Q$ is to be connected to its collector resistor R. A logic function can be obtained by connecting several outputs $Q$ to one common resistor R.

Terminals:

1. $G_{1}=$ gate input
2. $\mathrm{G}_{3}=$ gate input
3. not connected
4. not connected
5. $\mathrm{EG}_{1}=$ extension gate input
6. $\mathrm{Q}_{1}=$ output
7. $\mathrm{R}_{1}=$ connection collector resistor
8. not connected
9. $\mathrm{N}=$ supply -12 V
10. $\mathrm{O}=$ common supply 0 V
11. $\mathrm{G}_{2}=$ gate input
12. $\mathrm{K}=$ cathode separate diode
13. not connected
14. anode separate diode
15. $E G_{2}=$ extension gate input
16. $\mathrm{Q}_{2}=$ output
17. $\mathrm{R}_{2}=$ connection collector resistor
18. $\mathrm{P}_{2}=$ supply +6 V
19. $\mathrm{P}_{1}=$ supply +12 V

## Type number: 2P 73735

Colour of insulating sleeve: red
The unit contains a latch flip-flop for d.c. logic operations. Upon application of the 0 V level to one of the set inputs S , the corresponding output Q resumes the positive level and the other output the OV level.
The positive level applied to a set input has no effect.
A logic function is obtained by connecting external diodes to an extension set input ES; the diodes form an OR function on the OV level.

## Terminals:

1. not connected
2. $E S_{1}=$ extension set/reset input
3. not connected
4. internally connected
5. $\mathrm{S}_{1}=$ set/reset input
6. $\mathrm{Q}_{1}=$ output
7. not connected
8. $S_{1}=$ set/reset input
9. $N=$ supply -12 V
10. $\mathrm{O}=$ common supply 0 V
11. not connected
12. $E S_{2}=$ extension set/reset input

14. internally connected
15. $\mathrm{S}_{2}=$ set/reset input
16. $\mathrm{Q}_{2}=$ output
17. not connected
18. $\mathrm{P}_{2}=$ supply +6 V
19. $P_{1}=$ supply +12 V

## 20 series - CIRCUIT BLOCKS

## UNITS WITH A MEMORY FUNCTION

## FF23 - FLIP-FLOP

Type number: 2P 73722
Colour of insulating sleeve: red
The unit contains a general-purpose triggered flip-flop. Trigger pulses are applied to trigger inputs T .
The built-in trigger gates are opened by a positive level applied to the gate inputs $G$ and are closed by a $O V$ level. A binary counter is made by connecting $G_{1}$ to $Q_{2}$, and $G_{2}$ to $Q_{1}$.
A shift register is made by connecting $G_{1}$ and $G_{2}$ of one circuit block to the terminals $Q_{1}$ and $Q_{2}$ respectively of the preceding flip-flop.
Applied as binary counter or as shift register the trigger inputs $T_{1}$ and $T_{2}$ have to be connected.
A twin trigger gate 2.TG23 may be connected to the base inputs $B$ to obtain more triggering facilities (e.g. for bi-directional shift registers and counters).
A logic function is obtained by connecting external diodes to an extension set input ES and/or extension gate input EG.
Multiple clock lines may be applied via diodes connected to the extension trigger input ET.

Terminals:

1. $\mathrm{EG}_{1}=$ extension gate input
2. $E S_{1}=$ extension set/reset input
3. $\mathrm{ET}_{1}=$ extension trigger input
4. $\mathrm{B}_{1}=$ extension trigger gate
5. $\mathrm{G}_{1}=$ gate input
6. $Q_{1}=$ output
7. $\mathrm{T}_{1}=$ trigger input
8. $S_{1}=$ set/reset input
9. $\mathrm{N}=$ supply -12 V
10. $\mathrm{O}=$ common supply 0 V
11. $E G_{2}=$ extension gate input
12. $E S_{2}=$ extension set/reset input
13. $\mathrm{ET}_{2}=$ extension trigger input
14. $\mathrm{B}_{2}=$ extension trigger gate
15. $G_{2}=$ gate input
16. $\mathrm{Q}_{2}=$ output
17. $\mathrm{T}_{2}=$ trigger input
18. $\mathrm{P}_{2}=$ supply +6 V
19. $\mathrm{P}_{1}=$ supply +12 V

## CIRCUIT BLOCKS - 20 series

Type number: 2P 73725
Colour of insulating sleeve: orange
The circuit is identical to the trigger gate in the general-purpose triggered flipflop FF23.
When the outputs $B_{1}$ and $B_{2}$ of the trigger gate 2.TG23 are connected to the inputs $B_{1}$ and $B_{2}$ of the flip-flop FF23 respectively, the inputs $G$ and $T$ of the 2.TG23 operate in the same way as the corresponding inputs of the FF23. Thus with this trigger gate a second pair of trigger inputs are formed for the flip-flop FF23, to make one stage of a bi-directional counter or shift register.

Terminals:

1. $E G_{1}=$ extension gate input
2. not connected
3. $E \mathrm{~T}_{1}=$ extension trigger input
4. $\mathrm{B}_{1}=$ extension trigger gate
5. $G_{1}=$ gate input
6. not connected
7. $\mathrm{T}_{1}=$ trigger input
8. not connected
9. not connected
10. $\mathrm{O}=$ common supply 0 V
11. $\mathrm{EG}_{2}=$ extension gate input
12. not connected
13. $\mathrm{ET}_{2}=$ extension trigger input
14. $\mathrm{B}_{2}=$ extension trigger gate
15. $G_{2}=$ gate input
16. not connected
17. $\mathrm{T}_{2}=$ trigger input
18. not conected
19. $\mathrm{P}_{1}=$ supply +12 V

## 20 series - CIRCUIT BLOCKS

## UNITS WITH A PULSE SHAPING FUNCTION

## OS20 - ONE-SHOT MULTIVIBRATOR

Type number: 2P $737 \mathbf{2 6}$
Colour insulating sleeve: green.
This unit contains a triggered monostable (one-shot) multivibrator. Trigger pulses are applied to trigger input T. A limited number of diodes connected to extension trigger input ET can provide further trigger inputs.
The built-in trigger gate is opened by a positive level applied to the gate input EG and is closed by a 0 V level. A diode is required to separate each gate source from input EG.
The duration of the output pulse can be decreased by a resistor connected either between terminals $R$ and $P_{1}(3)$ or $R$ and $E C_{1}$. In order to increase the duration a capacitor can be connected between $\mathrm{EC}_{1}$ and $\mathrm{EC}_{2}$.
A twin trigger gate 2.TG23 connected to input $B$ can provide more trigger facilities.

Terminals:

1. $\mathrm{EC}_{1}=$ external capacitor 1
2. $\mathrm{R}=$ external resistor
3. $\mathrm{P}_{1}=$ external resistor
4. not connected
5. not connected
6. $\mathrm{Q}_{1}=$ output 1
7. $\mathrm{EC}_{2}=$ external capacitor 2
8. not connected
9. $\mathrm{N}=$ supply -12 V
10. $\mathrm{O}=$ common supply OV
11. $\mathrm{EG}=$ extension gate input
12. not connected
13. $\mathrm{ET}=$ extension trigger input
14. $\mathrm{B}=$ extension trigger gate
15. not connected
16. $\mathrm{Q}_{2}=$ output 2
17. $\mathrm{T}=$ trigger input
18. $\mathrm{P}_{2}=$ supply +6 V
19. $\mathrm{P}_{1}=$ supply +12 V

## CIRCUIT BLOCKS - 20 series

## UNITS WITH A PULSE SHAPING FUNCTION

PULSE SHAPER PS20

Type number: 2P 73727
Colour insulating sleeve: green
The unit PS20 contains a Schmitt trigger (squaring) circuit followed by an inverting amplifier.
A voltage in excess of the ON-threshold voltage at input terminal B gives a 0 V level at output terminal Q ; a voltage below the OFF-threshold voltage at terminal B gives a positive level at output Q . The output voltage transients are suitable for driving multivibrator circuits at the trigger inputs $T$.
The pulse shaper can be driven by external sources as well as by circuit blocks of the 20 -series.

Terminals:

1. $\mathrm{B}=$ direct base input
2. not connected
3. $X_{1}=$ internally connected
4. $A=$ resistor input
5. $\mathrm{D}=$ common supply $0 V$ (interconnected with terminal 10)
6. $X_{2}=$ internally connected
7. not connected
8. not connected
9. $N=$ supply -12 V
10. $\mathrm{O}=$ common supply OV
11. not connected
12. not connected
13. $C=$ internally connected
14. not connected
15. not connected
16. $\mathrm{Q}=$ output
17. not connected
18. $\mathrm{P}_{2}=$ supply +6 V
19. $P_{1}=$ supply +12 V

## 20 series - CIRCUIT BLOCKS

## UNITS WITH A PULSE SHAPING FUNCTION

2RL22-TWIN LEVEL RESTORER

Type number: 2P 74809
Colour insulating sleeve: green
This unit is intended to convert 3 V signal levels on lines to standard signal levels used in the " 20 series" of circuit blocks. It is normally used in conjunction with the twin line driver 2LD21. The input impedance is high. The unit is suited for multiple receiving.

Terminals:

1. not connected
2. $\mathrm{O}=$ common supply 0 V
3. not connected
4. not connected
5. not connected
6. $\mathrm{Q}_{1}=$ output
7. $\mathrm{R}_{1}=$ connection collector resistor
8. not connected
9. $\mathrm{N}=$ supply -12 V
10. $\mathrm{O}=$ common supply 0 V
11. $\mathrm{W}_{1}=$ input
12. $\mathrm{W}_{2}=$ input
13. not connected
14. not connected
15. not connected
16. $\mathrm{Q}_{2}=$ output
17. $\mathrm{R}_{2}=$ connection collector resistor
18. $\mathrm{P}_{2}=$ supply +6 V
19. not connected

TWIN LINE DRIVER - 2LD21

## Type number: 2P 74808

Colour insulating sleeve: yellow
This unit is intended to apply a sigrial level of 3 V to a line or other termination of $75 \Omega$. The line terminals, in such case, are Q and O .
The line driver is generally fed from a line receiver 2.LR22,
To match a cable to the circuit an appropriate resistor is to be connected between E and the signal leg of the pair, while leaving Q floating.
A gate inverter (2.GI20, 2. GI21, or 2.GI22) can feed into the control input C, so performing a logic function. The collector resistance (terminal R ) is not connected for this application.

Terminals:

1. $\mathrm{G}_{1}=$ gate input
2. $E G_{1}=$ extension gate input
3. not connected
4. not connected
5. $\mathrm{Q}_{1}=$ output $75 \Omega$
6. $\mathrm{C}_{1}=$ logic gate input
7. $\mathrm{E}_{1}=$ output
8. not connected
9. $\mathrm{N}=$ supply -12 V
10. $\mathrm{O}=$ common supply 0 V
11. $\mathrm{G}_{2}=$ gate input
12. $E G_{2}=$ extension gate input
13. not connected
14. not connected
15. $\mathrm{Q}_{2}=$ output $75 \Omega$
16. $\mathrm{C}_{2}=$ logic gate input
17. $\mathrm{E}_{2}=$ output
18. $\mathrm{P}_{2}=$ supply +6 V
19. $P_{1}=$ supply +12 V

The units FF22 and PD20 are under development.

## Loading Rules

1. Verify that the sum of the required d.c. input currents of the driven units does not exceed the available d.c. output current of the driving unit.
2. When, however, T-inputs are incorporated in the driven units, the transient charges must also be verified.
3. The wiring capacitance consumes an extra charge of $3.5 \mathrm{pC} / \mathrm{pF}$.
4. T-inputs of closed gates do not require any current or charge.
5. The verifications mentioned above warrant reliable operation at the worst combination of supply voltage tolerances and ambient temperatures between 0 and $+85^{\circ} \mathrm{C}$. For operation at lower temperatures, the data for each type are given in the individual data sheets.

Norbits ${ }^{1}$ are standardised static switching elements of special design and with the following features: high reliability, long life, easy mounting, dust-proof, etc. They can be used in industrial control systems, such as lift control, traffic control, machine control, process control, recording control, transfer line control, alarm and annunciator systems.

It is possible to perform a large number of control functions with a small number of types.
The basic element, the NOR-unit, is capable of performing the logical function AND/OR and NOT, whilst sequential logic circuits such as flip-flops can be built up from two or more of these NORunits. The series Norbits further includes ancillary elements for adaptation to industrial equipment.

$$

Dimensional drawing of the basic Norbit case

## Colour code of flexible leads

[^4]
## NORBITS

## SINGLE NOR-UNIT TYPE YL6000

Colour: red
The unit is capable of performing the basic logic functions AND, OR and NOT. The input signals can be derived either from a previous unit or from a suitable transducer. The unit can drive 6 other NOR-units.

## EMITTER FOLLOWER UNIT YL6001

Colour: yellow
The unit comprises a transistor current amplifier in com-mon-collector connection for use as driver for medium power unit YL6008; it can also drive 17 standard Norbits.

DOUBLE HIGH-POWER OUTPUT UNIT YL6004

Colour: not coded
The unit consists of two highpower amplifiers which may be used separately. The input of each amplifier must be driven by an YL6009. Load resistance is $4.3 \Omega \mathrm{~min}$. Available output current max. 6 A.

Overall dimensions: $255 \mathrm{~mm} \times 70 \mathrm{~mm} \times 40 \mathrm{~mm}$

## Colour: violet

Unit YL6005/01 consists of 3 single binary counters YL6005/05 (bistable multivibrator; see diagram)

${ }^{T}{ }^{\top} \mathrm{A}$ : counter A terminals
TB $B$ : counter $B$ terminals
TB C: counter $C$ terminals TB D: supply for all 3 counters

Overall dimensions:
T.B.A T.B.B
T.B.C T.B.D

[^5]
## NORBITS

SINGLE BINARY COUNTER UNIT YL6005/05

Top view of 3 plastic cases Colour: violet

Dimensions: 3 units, each $64 \mathrm{~mm} \times 42 \mathrm{~mm} \times 12 \mathrm{~mm}$

The aluminium chassis can be used for mounting 12 units, it is equipped with 2 terminal blocks each having 5 contacts.

Overall dimensions: $254 \mathrm{~mm} \times 70 \mathrm{~mm} \times 31 \mathrm{~mm}$

MEDIUM-POWER OUTPUT UNIT YL6008

Overall dimensions: $64 \mathrm{~mm} \times 42 \mathrm{~mm} \times 32 \mathrm{~mm}$

Colour: orange
The unit must be driven by an emitter-follower YL6001 and has been designed to drive relays; load resistance $16 \Omega \mathrm{~min}$. Available output current max. 1.5 A.

## NORBITS FOR INDUSTRIAL CONTROL

## LOW-POWER AMPLIFIER UNIT YL6009

Colour: white
This unit has been designed as low-power amplifier to drive lamps or relays (load resistance $300 \Omega \mathrm{~min}$.). Available output current max. 125 mA .

## PHOTO-ELECTRIC DETECTOR HEAD YL6030

Colour: not coded
The unit consits of a photo-transistor used in a tempera-ture-compensated circuit. The light enters the unit via a lens with an adjustable diaphragm. The unit operates satisfactorily with lamphead YL6011 at distances up to 2.40 m .

Dimensions:
$112 \mathrm{~mm} \times 44.2 \mathrm{~mm} \times 34.6 \mathrm{~mm}$

## LAMP HEAD YL 6031

Colour: not coded
The unit has the same type of housing as $\mathrm{Y} L 6030$ and contains a 6 V lamp which can be used for various distances.

## DOUBLE NOR-UNIT YL6018

Colour: black
The unit is complementary to the standard NOR-unit YL6000 and comprises two NORcircuits. One circuit has three, the other two inputs. Either circuit can drive 6 NOR-units.

TIMER UNIT YL6015
Colour: brown
The unit consists of a RC delay circuit, coupled to a Schmitt trigger, and can provide delays in 3 ranges from 0.02 to 60 s , which can be realised by different interconnections outside the unit.

Connections:

Dimensions:
$64 \mathrm{~mm} \times 40.4 \mathrm{~mm} \times 75 \mathrm{~mm}$

## NOREITS

## LOADING TABLE

The inputs and outputs of the different units may be interconnected directly. The power required to drive one of the six inputs of a NOR-unit YL6000 is defined as one "DRIVE UNIT" (abbreviated to D.U.).
The amount of power which can be delivered by the YL6000 is 6 DRIVE UNITS. The following loading table is based on the above-defined "DRIVE UNIT" which is additive.

| type | input power required | output power available |
| :---: | :---: | :---: |
| NOR-UNIT YL6000 | 1 D.U. | $6 \mathrm{D} . \mathrm{U}$. |
| Emitter follower unit Y 6001 . | $6 \mathrm{D} . \mathrm{U}$. | 17 D.U. |
| Double high-power unit YL6004 . | output of YL6009 | 24V, 6A |
| Counter units YL6005/01 and YL6005/05 . | $4 \mathrm{D} . \mathrm{U}$. | each output may drive: <br> 1 YL6005 + 1 YL6001 <br> or YL6005 + 2 YL6009 <br> or 1 YL 6001 <br> or 2 YL6000/YL6018 |
| Medium-power output unit YL6008 | 14 D.U. | 24V, 1.5A |
| Low-power output unit YL6009 . . . . . | 3 D.U. | $24 \mathrm{~V}, 125 \mathrm{~mA}$ |
| Photo-electric detector head YL6030 . | from light source YL6011 | $6 \mathrm{D} . \mathrm{U}$. |
| Double Nor-unit YL6018 . | 1 D.U./circuit | 6 D.U./circuit |
| Timer unit YL6015 . . . . . . . . | input 1:6D.U. input 2:6D.U. | $6 \mathrm{D} . \mathrm{U}$. |

Example:
One NOR-unit YL6000 is just able to supply the power (6 D.U.) for one Emitter Follower Unit YL6001. The YL6001, in turn, is capable of driving up to 17 NOR-units YL6000 or one medium-Power Output Unit YL6008 plus 3 NOR-units YL6000 etc.

The vane-switched oscillator unit consists of an oscillator and a diode rectifier. The latter is connected to a separate coupling winding of the oscillator coil, thus providing an isolated d.c. output.
The lay-out of the oscillator is such that upon inserting a suitable piece of metal (vane) in a gap between the oscillator coil windings, the oscillation stops and the d.c. output of the unit will drop to zero. The complete circuit is encapsulated in epoxy resin. The VSO can be applied as a static switching device, the switching action being determined by the position of the vane. For the vane any metal can be used.
The unit may be mounted in any position; two mounting holes allow the use of 4 mm bolts. Stacking of units is permitted. Connection can be made by 0.110 Faston tabs or by soldering.

## ANGULAR DISPLACEMENT TRANSDUCER PE2270

The transducer converts the angular displacement of a shaft into electric signals. The robust casing of the transducer is so mounted that its expanding bellows presses against the shaft whose displacement is to be ascertained. Any rotation of the shaft is thus accompanied by a corresponding rotation of a slotted disk. The standard disk is provided with 250 radial slots. When this disk is turned, the partitions between the slots intercept the light directed by a self-focusing lamp onto a photo-transistor. Due to the presence of a mask with four slots, $4 \times 250$ output signals are produced per complete revolution of the shaft. These signals can be fed to a pulse shaper PS1 which may, for example, control a digital positioning system.

1. self-focusing lamp
2. slots
3. slotted disk
4. mask
5. photo-transistor
6. bellows
7. machine shaft
8. machine.

In the booklet "Counting units for programmed control'" examples are given of the application of counting units in automatic number machines, time control equipment, and automatic distribution installations.

Dimensions and arrangement of the connectors on a chassis with four units.

## COUNTING UNITS FOR PROGRAIMMED CONTRDR-

The series 88930 comprises a total of eight main units and three sub-units. The latter, the functions of which are also included in those of the main units, can be built in separately, if required.

| frequency range . . . . . . | $0-2 \mathrm{kc} / \mathrm{s}$ |
| :--- | :--- |
| maximum ambient temperature | $+45^{\circ} \mathrm{C}$ |
| counting pulse . . . . .. | $\mathrm{V}=135 \pm 5 \mathrm{~V}$; duration $=25 \pm 10 \mu \mathrm{~s}$ |
| reset pulse ........ $\mathrm{V}=280 \mathrm{~V}$; duration approximately $100 \mu \mathrm{~s}$ |  |
| output signal of relay tubes . . . approx. 100 V at $100 \mathrm{k} \Omega$ |  |
| output power of relay amplifier. | 0.8 VA at $600 \Omega$ |

All data-handling systems employ some sort of device for the storage of information. Such a "memory" can accept, store and supply the information at any required moment. For this purpose a magnetic core memory is very often used.
The storage capacity of a magnetic core is the result of its property to assume either of two stable magnetic states. One magnetic state is maintained, until it is made to change into the other.
The main features which can be distinguished are as follows:
(1) read/write cycle time of only a few microseconds;
(2) random access;
(3) the information can be stored for an indefinite period;
(4) storage of large quantities of information in a small volume.

The properties of the cores described below are such that the cores are specially suited for use in coincident current memories.
We draw your attention to the low-temperature-coefficient (LTC) cores, the electrical properties of which are substantially constant over a wide temperature range.

## DEFINITIONS OF TERMS AND SYMBOLS

$\mathrm{I}_{\mathrm{m}}=$ peak value of the drive current.
The peak value of the drive current is the maximum amplitude of the pulse, disregarding overshoot and ripple.
$I_{w}=$ full write pulse.
The full write pulse will switch the core - when in the ZERO state - into the ONE state.
$\mathbf{I}_{\mathrm{pw}}=$ partial write pulse
$I_{r}=$ Full read pulse.
The full read pulse will switch the core - when in the ONE state - into the ZERO state
$\mathrm{I}_{\mathrm{pr}}=$ partial read pulse
The partial read pulse will not switch the core when in the ONE state - into the ZERO state
D.R. = disturb ratio,
the ratio of the partial drive current to the full drive current ( $I_{\mathrm{pw}} / \mathrm{I}_{\mathrm{w}} ; \mathrm{I}_{\mathrm{pr}} / \mathrm{I}_{\mathrm{r}}$ ).
$\mathrm{tr}_{\mathrm{r}}=$ rise time.
Time interval between 0.1 Im and $0.9 \mathrm{I}_{\mathrm{m}}$ points of the leading edge of the current pulse.
$\mathrm{td}_{\mathrm{d}}=$ pulse duration.
Time interval between 0.9 Im points of the current pulse.

Drive current pulses

## DEFINITIONS OF TERMS AND SYMBOLS

## Responses.

$u V_{1}=$ peak value of the undisturbed ONE response voltage.
The $u V_{1}$ is obtained at a full read pulse ( $I_{r}$ ) when this pulse is preceded by a full write pulse ( $\mathrm{I}_{\mathrm{w}}$ ).
$r V_{1}=$ peak value of the disturbed ONE reponse voltage.
The $r V_{1}$ response is obtained at a full read pulse ( $\left.\right|_{r}$ ) preceded by a full write pulse followed by 32 partial read pulses ( $I_{\mathrm{pr}}$ ).
$w V_{z}=$ peak value of the disturbed ZERO response voltage.
The $w V_{z}$ is obtained at a full read pulse ( $I_{r}$ ) preceded by a full read pulse ( $I_{r}$ ) followed by 32 partial write pulses ( $l_{\text {pw }}$ ).
$U R=u V_{1}-r V_{1}$.
The difference between the peak values of the $u V_{1}$ and $r V_{1}$ responses of the individual cores. This value is a measure for the rectangularity of the hysteresis loop.

$$
\begin{aligned}
V_{\mathrm{ref}}= & \text { the reference voltage that is usually, de- } \\
& \text { fined as } 10 \% \text { of the quaranteed } r V_{1} \text { value } \\
& \text { of each individual core. }
\end{aligned}
$$

$\mathrm{t}_{\mathrm{p}}=$ peaking time.
$t_{p}$ is the core peaking time as measured from the time at which the leading edge of the $r V_{1}$ response reached the reference value ( $V_{\text {ref }}$ ).
$\mathrm{t}_{\mathrm{s}}{ }^{\prime}=$ switching time
$\mathrm{t}_{\mathrm{s}}$ is the time interval between 0.1 Im point of the leading edge of the current pulse and the time at which the trailing edge of the $r V_{1}$ response reached the reference value ( $V$ ).

## Test conditions

Tests are carried out on each individual core threaded with a single drive wire and a sense wire loaded with $100 \Omega$ (see figure above).
The cores are tested according to the test pattern given above. They are tested at an ambient temperature of $40^{\circ} \mathrm{C}$, except the low-temperature-coefficient (L.T.C.) cores, which are measured at the minimum and maximum permissible temperatures.
To provide for a $10 \%$ tolerance on the drive current, the tests are carried out with full write- and read-pulses of $0.9 \mathrm{I}_{\mathrm{m}}$ and with partial write- and read-pulses of $0.55 \mathrm{I}_{\mathrm{m}}$, corresponding to a disturb ratio of 0.61 .

## Measured values

All cores must meet the requirements of minimum $r V_{1}$ and maximum permissible $w V_{z}$. The values of $r V_{1}$ and $w V_{z}$ are read after 32 partial read pulses and 32 partial write pulses respectively.
The $u V_{1}$ value is measured after one write pulse followed by one read pulse. Each core is, moreover, tested on its peaking time, switching time and UR value. In addition to the individual cores being tested, the distribution curves of the different parameters within a lot are checked.

## MATRIX PLANES AND STACKS

## GENERAL

The matrix planes and stacks mentioned in this booklet are specially designed for coincident current operation. They consist of a number of magnetic cores arranged in rows and columns through which four copper wires are threaded according to the MIT system, namely:
2 drive wires (" $X$ "' wire, " $Y$ " wire)
1 inhibit wire (" $Z$ " wire)
1 sense wire (" S " wire)

Magnification of part of a coincident current matrix plane exposing the 4 wires passing through each core

The matrix planes contain one, two or four matrices, for example $4 \times 16 \times 16$. Each matrix of the multiplex planes has a separate sense and inhibit wire. Each type of plane is available in two versions: a left-hand and a right-hand version. These two planes have a mirror-symmetrical tag lay-out.
Matrix planes with $80 \mathrm{mil}, 50 \mathrm{mil}, 30 \mathrm{mil}$ and 20 mil cores are available in standard executions. On request matrices with 150 mil cores and matrices differing from the standard types can be supplied. A stack is composed of left-hand and right-hand planes, stacked alternately. In this way the tags of the adjacent planes are just above each other, which facilitates an easy interconnection of the drive wires. The stacks are delivered with the drive wires interconnected. Plates are added at the top and bottom of the stack for protecting the upper and lower planes. The total assembly is secured by bolts which pass through the corner holes of the planes.

## Testing method

All cores in each plane are tested to make sure that the cores satisfy the specification. Planes are tested at $23^{\circ} \mathrm{C}$ with marginal drive currents (disturb ratio $0.62-0.63$ ).
Each core is tested with the pulse patterns given on next page.
The " 1 " output of each core is measured with all cores in the " 1 " (best pattern).
The cores are tested to guarantee a minimum permissible " 1 " output at maximum and minimum values of " $\mathrm{t}_{\mathrm{s}}$ " and " $\mathrm{t}_{\mathrm{p}}$ ".
Furthermore the cores are tested for disturb sensitivity by increasing the disturb ratio from 0.5 to 0.63 or higher values. This is done to measure the output with and without p.w.d. pulse. If the difference of these values exceeds a given limit, the cores are rejected. It is also checked whether the sense wire passes through all cores.

## GENERAL

The " 0 " output of each core is measured with all cores in the " 0 " state (best pattern). The cores are tested to guarantee maximum permissible " 0 " output. At the same time it ensures that the inhibit wires pass through all cores and that the noise cancelation of the sense wire is adequate.
Sample tests are carried out with all the cores set in checkerboard pattern (worst pattern), for the peak value of the " 0 " output (peak delta noise) and the " 0 " output at peaking time of the " 1 "' output. Besides the electromagnetical testing, the planes are tested on insulation resistance and on the d.c. resistances of the X -, Y -, Z- and S -wire. After assembly the stacks are functionally tested.

## MATRIX PLANES AND STACKS

## WITH 80 MIL CORES

Ferroxcube memory cores type 6B2 are threaded in two types of standardised frame, type A for maximum $32 \times 32$ cores and type $B$ for maximum $64 \times 64$ cores. Both frames are made of special synthetic resin. The frames are provided with grooves to hold the wires that run to the soldering tags. The matrix planes are wired with copper enamelled wire SWG 36. ( 0.2 mm diameter).
The types of the standard range are listed below.

## Standard range of planes

| number of cores | wiring |  |  |  | frame | type number |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $X$ | $Y$ | $Z$ | S |  | 6B2 core |

| $32 \times 32$ | 2 | 2 | 1 | 1 | B | B1 66921 |
| $32 \times 32$ | 2 | 2 | 1 | 1 | B | B1 66922 |

Dimensions

| frame | outer dimensions <br> $(\mathrm{mm})$ | pitch of mounting <br> holes <br> $(\mathrm{mm})$ | diameter <br> mounting <br> holes <br> $(\mathrm{mm})$ | stacking <br> height <br> $(\mathrm{mm})$ |
| :---: | :---: | :---: | :---: | :---: |
| A | $112 \times 112$ | $80 \times 80$ | 4.3 | 7 |
| B | $202 \times 202$ | $170 \times 170$ | 5.3 | 8.5 |

Please indicate in your order whether the planes must be delivered separately or in stacks.

Stacks with 80 mil matrix planes are delivered with two protective covers of methacrylate.
The drive wires of the various matrix planes are connected in series.
The soldering tags are easily accessible for soldering.

## MATRIX PLANES, STACKS AND BOXES

WITH 50 MIL CORES
Matrix planes

The frames in which the matrices are mounted consist of 8 Standard Resin Bonded Fibre strips (S.R.B.F.) in 4 pairs. Between each pair of strips, gold-plated bronze tags for terminating the wires are inserted. The strips have grooves spaced at $50 \mathrm{mil}(1.27 \mathrm{~mm})$ in which the wires run to the soldering tags. On these tags the wires are wrapped and dip-soldered. The matrices are wired with enamelled copper wire S.W.G 40 ( 0.12 mm diameter). The cores are arranged according to the "closed" pattern configuration (see figures below). The sense wire consists of four parts: these are seriesconnected by interconnecting the corresponding soldering tags.

The inhibit wires run parallel to the " $X$ " wires in the left-hand planes, and parallel to the " $Y$ " wires in the right-hand ones. The planes containing one matrix are provided with extra parallel connections so that the inhibit-wire terminals are located above each other when the planes are stacked.
As can be seen from the figures a left-hand plane can easily be transformed into a right-hand one by turning it over $90^{\circ}$; only two interconnections of the sense wire must be changed.
The principal corner marked by a yellow dot indicates the crossing of the " $X_{0}$ " and " $Y_{0}$ " drive wires. For those cases where special requirements are imposed on the electrical and mechanical properties, lacquered matrices are available.

Right-hand matrix plane

## MATRIX PLANES, STACKS AND BOXES

## WITH 50 MIL CORES

Matrix stacks

The stacks are built-up of left-hand and righthand planes, stacked alternately. The tags of two adjacent planes are so near to each other that they can be dip-soldered. In this way all " $X$ " and all " $Y$ " drive wires of the stacked planes are series-connected. The " $X$ " and " $Y$ ", drive lines thus obtained end on rigid terminals which are inserted in the termination planes at the top and bottom of the stack. On demand the stack can be provided with connection leads for the X -, Y -, Z - and S -wires.
For stacks built-up from matrix planes containing two or four matrices, the termination plane at the top of the stack can be replaced by an interconnection plane. Interconnection wires in the latter connect one half of the " X " drive lines to the other half of the " $X$ " drive lines; similar wires connect one half of the " $Y$ "' drive lines to the other half. The beginnings and ends of all drive lines are thus accessible on tags in the bottom frame only.
Example: A stack with 5 matrix planes, $4 \times 16 \times 16$ cores, provided with an interconnection plane functions as a stack of 20 planes with $16 \times 16$ cores. The above-mentioned solution is attractive to obtain with the same number of bits a smaller stack height at a lower cost.
To identify the soldering tags of the stack, the bottom protection plate is marked $\mathrm{A}, \mathrm{B}, \mathrm{C}, \mathrm{D}$, the top plate with E, F, G, H. The principal corner is indicated by a yellow dot (see photo).
This corner is determined by the crossing of the $X_{0}$ and $Y_{0}$ addresses. For testing the stack with the most unfavourable " 1 " and " 0 " outputs, the cores must be set in the worst-case pattern. It should be recognised that the worst-case patterns for the left-hand and right-hand planes in the stack are not identical.

Worst-case pattern left-hand planes

## MATRIX PLANES, STACKS AND BOXES

## WITH 50 MIL CORES

Boxes

Stacks mounted in boxes have the advantage of being protected against damage and dust. These boxes contain two identical aluminium end plates with apertures for the connection of the " $X$ " and " $Y$ " wires. The connections for the " $S$ " and " $Z$ " wires are on the side panels. All connections of the boxes are provided with taper-tab receptacles (AMP serial no. 78).
Two types of box are available: for matrix planes with up to $32 \times 32$ cores and for those with a maximum of $64 \times 64$ cores. The outer dimensions of these boxes are $145 \times 145 \mathrm{~mm}$ and $180 \times 180 \mathrm{~mm}$ respectively.
Up to 100 matrix planes can be housed in one box.

## MATRIX PLANES, STACKS AND BOXES

## WITH 50 MIL CORES

A number of current types has been standardised (see table below).
Each type can be supplied in three different executions, depending on the type of core requested.
The matrix planes are defined by the number of cores, the wiring and the type of core. In the table below the different standard types with the more important dimensions are indicated.

Matrix plane with 50 mil cores

## Standard range

| plane indication | wiring |  |  |  | number of cores | outer dimensions planes in mm |  | pitch of mounting holes in mm |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | X | Y | Z | S |  | $\begin{gathered} \text { length } \\ \mathrm{A} \end{gathered}$ | $\begin{gathered} \text { width } \\ \text { B } \end{gathered}$ | length | $\begin{gathered} \text { width } \\ D \end{gathered}$ |
| 02 | 1 | 1 | 1 | 1 | $32 \times 32$ | 80 | 80 | 59.5 | 59.5 |

## Examples

The type number of a left-hand matrix plane, lacquered, with $32 \times 32$ cores of ferroxcube 6C1 and wiring 1-1-1-1, is B8 62002/C24
The type number of a unlacquered stack containing 8 planes with $32 \times 32$ cores of ferroxcube 6C2 with interconnection plane is B 8749 02/308.
The type number of the same stack in box is B 8751 02/308.
Stack height is determined by
$(\mathrm{n}+2) 4.9+10 \mathrm{~mm}$, where n is the number of planes.
Box height is determined by
$(\mathrm{n}+2) 4.9+50 \mathrm{~mm}$.

## MATRIX PLANES AND STACKS

## WITH 30 MIL CORES

The mechanical design is similar to that of the matrix planes and stacks with 50 mil cores.
The frames are made of glass-epoxy of 4.9 mm thickness, the pitch of the grooves is 1.0 mm instead of 1.27 mm . The diameter for the " $X$ ", " $Y$ " and " $S$ " wires is 0.08 mm ; the inhibit wire has a diameter of 0.1 mm . The matrices are provided with 6F2 cores and the L.T.C. cores 6F3.

All the matrices of the $\mathbf{3 0} \mathbf{~ m i l}$ standard range are lacquered, to reduce the magnetostriction of the cores caused by the steep leading edge of the inhibit pulse.
Unlacquered planes will be delivered on request only.
Each type of matrix plane has one execution (in contrast to the matrices with 50 mil cores). To obtain a very low noise level special attention is paid to the sense wiring. This has resulted in a new type of sense wire, which differs from the normal MIT sense wire. Consequently the worst-case pattern differs from that of the 50 mil type. Moreover, the "open" core configuration is applied instead of the "closed" core configuration used for the 50 mil matrices (see p. B77 and the figure below).

To reduce the crosstalk between the inhibit and sense wire, their connections are kept far apart, differing in this respect from the 50 mil planes.
In a stack, built up from standard planes, the adjacent planes are at $90^{\circ}$ with respect to each other. In stacks built-up from four-fold planes the matrices are at $180^{\circ}$ with respect to each other. In both cases the inhibit wires run parallel to the " $X$ " wires in the one plane and to the " $Y$ " wires in the adjacent plane.
For the stacks built up with four-fold planes, the termination plane at the top can be replaced by an interconnection plane. On request the stack can be delivered with connection leads. For testing the stack with the most unfavourable " 1 " and " 0 " outputs, the cores must be set in the worst-case pattern indicated below.

## Worst-case pattern

| 1 | 0 | 0 | 1 | 1 | 0 | 0 | 1 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

|  |  |
|  | $\mathrm{M}=6 \mathrm{~F} 3$ cores |

Examples: The type number of a matrix plane with $4 \times 32 \times 32$ cores of Ferroxcube 6 F3 and wiring $1-1-4-4$, is B8 $62907 / \mathrm{M} 1$.
The type number of a stack containing 10 planes with $128 \times 128$ cores of Ferroxcube 6F2 with interconnection plane, is B8 $75824 / \mathrm{K} 510$.
Stack height is determined by $(\mathrm{n}+2) 4.9+10 \mathrm{~mm}$.
If desired 30 mil stacks can be supplied with connection leads.

## MATRIX PLANES AND STACKS

## WITH 20 MIL CORES

The matrices are provided with 6 H 1 cores and are lacquered. The mechanical design is similar to that of the 50 mil and 30 mil planes and stacks. The frames are made of glass-epoxy of 3.2 mm thickness, the pitch of the grooves is $0.635 \mathrm{~mm}(25 \mathrm{mil})$. The diameter for the wires is 0.06 mm . Special attention is paid to the sense wire configuration. The applied sense wire differs from the one used in the 30 mil planes.
For that reason the worst-case patterns of both are different. The tag lay-out and the connections for the sense and inhibit wires are identical to the 30 mil matrix planes (see figure). Also the composition of the 20 mil stack is the same as for the 30 mil stack, namely built-up with only one type of plane. For testing the stack with the most unfavourable " 1 " and " 0 " outputs, the cores must be set in the worstcase pattern which is indicated below.

## Worst-case pattern

| 1 | 0 | 1 | 0 | 0 | 1 | 0 | 1 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | 1 | 1 | 1 | 1 | 0 | 0 |
| 1 | 1 | 0 | 0 | 0 | 0 | 1 | 1 |
| 0 | 1 | 0 | 1 | 1 | 0 | 1 | 0 |
| 0 | 1 | 0 | 1 | 1 | 0 | 1 | 0 |
| 1 | 1 | 0 | 0 | 0 | 0 | 1 | 1 |
| 0 | 0 | 1 | 1 | 1 | 1 | 0 | 0 |
| 1 | 0 | 1 | 0 | 0 | 1 | 0 | 1 |

## Standard range

| plane indication | wiring |  |  |  | number of cores | outer dimensions of planes in mm |  | pitch of mounting holes in mm |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | X | Y | Z | S |  | $\begin{gathered} \text { length } \\ A \end{gathered}$ | $\begin{gathered} \text { width } \\ \text { B } \end{gathered}$ | length | $\begin{gathered} \text { width } \\ D \end{gathered}$ |
| 03 | 1 | 1 | 1 | 1 | $64 \times 64$ | 76 | 76 | 55.7 | 55.7 |
| 07 | 1 | 1 | 4 | 4 | $4 \times 32 \times 32$ | 76 | 76 | 55.7 | 55.7 |
| 08 | 1 | 1 | 4 | 4 | $4 \times 64 \times 64$ | 117 | 117 | 96.9 | 96.9 |
| 09 | 1 | 1 | 2 | 2 | $2 \times 16 \times 32$ | 56 | 53 | 35.4 | 35.4 |
| 10 | 1 | 1 | 2 | 2 | $2 \times 32 \times 64$ | 76 | 76 | 55.7 | 55.7 |
| 24 | 1 | 1 | 4 | 4 | $128 \times 128$ | 117 | 117 | 96.4 | 96.4 |
| 30 | 1 | 1 | 4 | 4 | $2 \times 64 \times 128$ | 117 | 117 | 96.4 | 96.4 |

Planes indicated in bold print are preferred types.

## Composition of the type number

Matrix plane B8 640 ../ N1
Stack

Examples. The type number of a matrix plane with $4 \times 64 \times 64$ cores (core type 6 H 1 ) and wiring $1-1-4-4$, is B8 $64008 / \mathrm{N} 1$.
The type number of a matrix stack containing 8 planes with $2 \times 64 \times 128$ cores, is B8 $77030 / \mathrm{N} 108$. Stack height is determined by $(\mathrm{n}+2) 3.2 \mathrm{~mm}$.

If clesired 20 mil stacks can be supplied with connection leads.

## PLATRICES

If a matrix plane with cut frames contains a small number of cores, the cost of the frame forms an important part of the total price. For that reason we have introduced a new range of small matrix planes in an inexpensive frame, called a plate matrix or PLATRIX. The platrices are provided with LTC cores type K5 $28146 / 6 C 2$ only, in a capacity range from 256 up to 1024 bits.
The wiring is according to the MIT-system. To reduce the required drive currents by a factor of two, each drive wire is threaded through the cores twice. In this manner matrix planes are obtained which can be used within a wide temperature range without need of current compensation. Comparatively low drive currents are neccessary for these matrices.
To keep the price of the platrices as low as possible, we have standardised them to 4 types, having different mechanical dimensions. Non-standard types can be supplied in large quantities only.

## Construction

The cores and wires are affixed to a paper-base laminate plate by means of a special lacquer, which withstands wide temperature variations. This construction is highly shock- and vibration proof. The platrices are provided with special L-shaped tags on the edges of the plate. This construction facilitates the assembly of the platrices in the grid of a printed-wiring board.

## Application

It is very attractive for applications in small bookkeeping-machines, invoice-machines, desk calculators, cash registers and machine-tool equipment, that the platrix can be provided with diodes and selection circuits on the same printed circuit board.

## Technical data

The tags are mounted with the standard pitch of $0.1^{\prime \prime}(2.54 \mathrm{~mm})$, but on request the platrices can be supplied with a pitch of 2.50 mm in accordance with the German DIN. The platrices meet the MILspecifications STD202. The maximum permissible inter-winding voltage is 80 V .
The insulation resistance exceeds $100 \mathrm{M} \Omega$. Each core is tested with marginal drive currents for a minimum $r V_{1}$ value of 28 mV . The wiring diagram for the single and four-fold designs are shown in Figs. 1 and 2 respectively.

## Standard range

Standard platrices with code numbers are tabled below.

| type number | number of cores | outer dimensions |
| :---: | :---: | ---: |
| B8 62601/L2 | $16 \times 16$ | $82 \times 82 \mathrm{~mm}$ |
| B8 62620/L2 | $2 \times 8 \times 16$ | $82 \times 82 \mathrm{~mm}$ |
| B8 62617/L2 | $4 \times 8 \times 8$ | $82 \times 82 \mathrm{~mm}$ |
| B8 62625/L2 | $4 \times 10 \times 10$ | $102 \times 102 \mathrm{~mm}$ |
| B8 62620/L2 | $4 \times 12 \times 12$ | $100 \times 102 \mathrm{~mm}$ |
| B8 62604/L2 | $16 \times 32$ | $82 \times 122 \mathrm{~mm}$ |
| B8 62629/L2 | $2 \times 16 \times 16$ | $82 \times 122 \mathrm{~mm}$ |
| B8 62602/L2 | $32 \times 32$ | $122 \times 122 \mathrm{~mm}$ |
| B8 62609/L2 | $2 \times 16 \times 32$ | $122 \times 122 \mathrm{~mm}$ |
| B8 62606/L2 | $4 \times 16 \times 16$ | $122 \times 122 \mathrm{~mm}$ |

Platrices with a pitch of 2.5 mm bear the same type number, but the indication behind the obligue becomes L1 instead of L2.
Stacks with platrices up to 4 pieces maximum can be supplied with series-connected drive wires.

## COMPLETE MAGNETIC CORE MEMORIES

## SURVEY

A magnetic core memory is a device for the storage of digital information, such as is intended for use in data-handling systems. A complete magnetic core memory contains a memory stack and the associated circuits to drive it, e.g. current drivers, read amplifiers, timing unit, selection system, address register and input/output register. It may also comprise the required power supplies. The systems mentioned below are all assembled in a standard mounting chassis, use being made of plug-in printed circuit boards to mount all the circuitry. The range of systems comprises the following types.

| $\begin{gathered} \text { memory } \\ \text { type } \end{gathered}$ | capacity |  | cycle time ( $\mu \mathrm{s}$ ) | $\begin{aligned} & \text { access time } \\ & (\mu s) \end{aligned}$ | $\begin{aligned} & \text { core } \\ & \text { type } \end{aligned}$ | circuit blocks | ambient temperature range $\left({ }^{\circ} \mathrm{C}\right)$ |

## COMPLETE MAGNETIC CORE MEMORIES

MEMORY TYPE 4B5

1. Main characteristics
a. cycle time: $5 \mu \mathrm{~s}$
b. access time: $1.4 \mu \mathrm{~s}$
c. capacity:
$\left.\begin{array}{l}256 \text { words } \\ 1024 \text { words } \\ 2048 \text { words } \\ 4096 \text { words }\end{array}\right\} 8$ up to 40 bits
d. circuit blocks of the 20 -series (equipped with silicon semiconductors)
e. core type used: 6F3 (LTC core)
f. ambient temperature: $0-65^{\circ} \mathrm{C}$
g. modes of operation:
read/restore
clear/write new information
split cycle, read/write new information
h. mechanical dimension (independent of the number of words and bits)
height 400 mm
depth 275 mm
width 444 mm
i. required power supplies: +12 V ; -12 V ; +6 V ; max. 9 A max.2.5A max.2.2A

## COMPLETE MAGNETIC CORE MEMORIES

## MEMORY TYPE 4B5

## 2. Special characteristics

a. logic levels: " 1 " $=+6 \mathrm{~V}$
$" 0$ " $=0 \mathrm{~V}$
b. Switch core matrices are used for the selection of the $X$ and $Y$ lines of the stack.
c. A protection circuit is included in all systems to prevent damage to the eiectronic circuits or faulty operation if the supplied voltages are $10 \%$ higher or lower than nominal. This protection circuits also prevents the information stored in the system from being destroyed when the equipment is switched on or off.
d. Optionally a memory exerciser (minitester) can be supplied, which checks the system according to the following four patterns:
all "1"
all " 0 "
double checkerboard
double checkerboard complement
In the event of an error, the faulty address and bit will be indicated by a combination of lamps.

Mechanical dimensions of the tester:
height 133 mm
depth 275 mm
width 444 mm

memory exerciser 4B5 store

h. this system is delivered with
 the required power supplies (power consumption: max. 220 V, 3 A).
2. Special characteristics
a. logic levels: " 1 " $=+6 \mathrm{~V}$
" 0 " $=0 \mathrm{~V}$
b. optional extras:
level shifting circuits
memory exerciser
sequential addressing and sequential interlace

## 1. Main characteristics

a. cycle time: $\quad 2 \mu \mathrm{~s}$
b. access time: $0.75 \mu \mathrm{~s}$
c. capacity:
4096 words
8192 words
16384 words 4 up to 60 bits 4 up to 50 bits
d. circuit blocks of the 20 -series (equipped with silicon semiconductors)
e. core type used: 6F3 (LTC core)
f. ambient temperature: $0-50^{\circ} \mathrm{C}$
g. modes of operation:
read/restore
clear/write new information
split cycle, read/write new information
h. mechanical dimensions (dependent on the number of words and bits):
height 1300 mm
depth 275 mm
width 444 mm 50 bits store
i. required power supplies:
+12 V ; 16.5 A
-12 V ; 10.3 A
$+6 \mathrm{~V} ; 7.0 \mathrm{~A}$
for the 16384 words,
+48 V ; 10 A
$+10 \mathrm{~V} ; 2.75 \mathrm{~A}$
50 bits store
2. Special characteristics
a. logic levels: " 1 " $=+6 \mathrm{~V}$

$$
" 0 "=0 \mathrm{~V}
$$

b. The system is provided with a transformer selection system
c. All printed circuit boards are provided with monitoring points (test points)
d. Optional extras:

1. power supply control unit:
to avoid loss of information during switching on and off;
to switch off the system if any voltage or current exceeds its specified values
2. integrated tester for fault-finding according to the following patterns:
all "1"
all " 0 "
double checkerboard
double checkerboard complement

## COMPLETE MAGNETIC CORE MEMORIES

## MEMORY TYPE 65E15 (mass memory)

1. Main characteristics
a. cycle time: $15 \mu \mathrm{~s}$
b. access time: $2 \mu \mathrm{~s}$
c. capacity:

65536 words of 76 bits
d. circuit blocks of the 20 -series (equipped with silicon semiconductors)
e. core type used: 6D8
f. ambient temperature range $:+10$ to $+40^{\circ} \mathrm{C}$
g. modes of operation:

## read/restore

clear/write new information
split cycle, read/write new information
h. mechanical dimensions: the dimensions of a complete store, including power supplies, integrated tester control panel, are: $192 \times 80 \times 66 \mathrm{~cm}$
i. power supplies: power supplies are incorporated in the store input: $110 / 125 / 145 / 200 / 220 / 245 \mathrm{Vac}$, $50 / 60 \mathrm{c} / \mathrm{s}$, power consumption: approx. 800 VA
2. Special characteristics
a. logic levels:
input: "1": 2.5 V over $75 \Omega$
" 0 ": $\quad 1 \mathrm{~V}$ over $75 \Omega$
output: "1": $40 \mathrm{~mA}($ in $75 \Omega$ )
" $0^{\prime \prime}: \quad 1 \mathrm{~mA}($ in $75 \Omega$ )
b. Switch core matrices are used for the selection; type 6S2 core is used.
c. The store comprises:

1. power supplies $(+12 \mathrm{~V} ;-12 \mathrm{~V} ;+6 \mathrm{~V} ;-50 \mathrm{~V})$
2. check panel (to check voltages and currents)
3. memory exerciser testing the system according to the following patterns:
all "1"
all " 0 "
double checkerboard
double checkerboard complement
d. All printed circuit cards are provided with monitoring prints.

## COMPLETE MAGNETIC CORE MEMORIES

1. Main characteristics
a. cycle time: $\quad 1 \mu \mathrm{~s}$
b. access time: 350 ns
c. capacity:

16384 words of 32 bits
d. core type used: 6H1
e. ambient temperature: 10 to $40^{\circ} \mathrm{C}$
f. modes of operation:
read/restore
clear/write new information
split cycle, read/write new information
g. the mechanical dimensions for a 16384 word 32 bit system are:
height: 820 mm
depth: 500 mm
width: 600 mm
h. required power supplies: +12 V ; 5 A

$$
\left.\begin{array}{l}
+12 \mathrm{~V} ; 6 \mathrm{~A} \\
-12 \mathrm{~A} ; 6 \text { for the } 16384 \text { words } \\
+26 \mathrm{~V} ; 14 \mathrm{~A}
\end{array}\right\} 32 \text { bits store }
$$

2. Special characteristics
a. logic levels:
input: logic "1": $12 \mathrm{~V}: \pm 2 \mathrm{~V}$
logic " 0 ": $\quad 0 \mathrm{~V} ; \pm 1.5 \mathrm{~V}$
output: $\operatorname{logic} " 1$ ": $\quad 10 \mathrm{~V} ;+30 \mathrm{~mA}$
logic " 0 ": +1.5 V ; -36 mA
b. transformer selection is used.
c. Optional extras:
level shifting circuits
memory exerciser

## MOUNTING AIDS

## MOUNTING AIDS AND ACCESSORIES FOR CIRCUIT BLOCKS

## Mounting chassis

Two standardised types of chassis for the mounting of circuit blocks are available, both designed to be fitted in $19^{\prime \prime}$ racks.
The chassis of Fig. 1 can contain up to 21 standard printed-wiring boards together with their mating connectors type $\mathrm{F} 045 \mathrm{CC} / 025$, and can be mounted directly in a $19^{\prime \prime}$ rack.

Type number B871610, fig. 1
Chassis for circuit blocks mounted on printed-wiring boards

Type number B871609, fig. 2
Chassis for circuit blocks mounted side by side

Fig. 2

The chassis of Fig. 2 can contain up to 19 circuit blocks mounted side by side.
A number of these chassis can be mounted in a metal frame. Fitted in a standard $19^{\prime \prime}$ rack, 6 of these chassis can be mounted side by side.

MOUNTING AIDS AND ACCESSORIES FOR THE 10 SERIES AND 20 SERIES

## Type number B871611 fig. 1

This chassis can contain up to 21 standard p.w. boards together with their mating connectors, type F045CC025 (single-sided contacts) or type $\mathrm{F} 045 \mathrm{KC} / 025$ (double-sided contacts).

## MOUNTING AIDS AND ACCESSORIES FOR CIRCUIT BLOCKS

## Mounting chassis

This universal type of chassis for mounting circuit blocks of the 100 series, 10 series and 20 series and many other components is designed to be fitted in 19" racks.
The chassis can contain 21 printed-wiring boards with a length of 204 mm . Connector types F045 and F047 can be used.
A latch firmly locks the p.w. boards and prevents dislodgement due to vibration.
A number of these chassis (height 133 mm ) can be mounted in a metal frame. Six chassis can be mounted side by side in a standard $19^{\prime \prime}$ rack.

$$
\begin{array}{ll}
\text { Storage temperature range } & -55^{\circ} \mathrm{C} \text { to }+85^{\circ} \mathrm{C} \\
\text { Operating temperature range } & -25^{\circ} \mathrm{C} \text { to }+85^{\circ} \mathrm{C}
\end{array}
$$

## Mounting chassis

Type B871613 for connector 242202052591
Type B871615 for connector F047

| voltage <br> current <br> stability ratio <br> ripple <br> internal resistance <br> internal impedance <br> at $10 \mathrm{kc} / \mathrm{s}$ <br> at $100 \mathrm{kc} / \mathrm{s}$ <br> temperature coefficient at no load | $\begin{aligned} & +6 \mathrm{~V} \text {, adjustable } \pm 5 \% \\ & 150 \mathrm{~mA} \\ & >200: 1 \\ & <50 \mathrm{mV} \text { rms } \\ & 0.5 \Omega \\ & <0,5 \Omega \\ & 1 \Omega \text { approx. } \\ & +6 \mathrm{mV} \text { per deg. } \mathrm{C} \end{aligned}$ | $\begin{aligned} & -12 \mathrm{~V} \\ & 1 \mathrm{~A} \\ & >500: 1 \\ & 0.35 \mathrm{mV} \mathrm{r}_{\text {rms }} \\ & <55 \mathrm{~m} \Omega, 0-100 \% \text { load } \\ & \\ & +0.075 \mathrm{mV} \text { per deg. } \mathrm{C}^{1} \\ & +0.038 \mathrm{mV} \text { per deg. } \mathrm{C}^{2} \end{aligned}$ utput |
| voltage <br> current <br> stability ratio <br> ripple <br> internal resistance <br> internal impedance <br> at $10 \mathrm{kc} / \mathrm{s}$ <br> at $100 \mathrm{kc} / \mathrm{s}$ <br> temperature coefficient at no load | $\begin{aligned} & -6 \mathrm{~V} \text {, adjustable } \pm 5 \% \\ & 600 \mathrm{~mA} \\ & >300: 1 \\ & <50 \mathrm{mV} \text { rms } \\ & <0.3 \Omega \\ & <0.2 \Omega \\ & 1 \Omega \text { approx. } \\ & -3 \mathrm{mV} \text { per deg. } \mathrm{C} \end{aligned}$ | $\begin{aligned} & -12 \mathrm{~V} \\ & 400 \mathrm{~mA} \\ & 30: 1 \\ & 1 \mathrm{mV} \text { rms } \\ & <0.2 \Omega, 0-100 \% \text { load } \\ & \\ & -0.45 \mathrm{mV} \text { per deg. } \mathrm{C}^{1} \\ & -0.1 \mathrm{mV} \text { per deg. } \mathrm{C}^{2}{ }^{2} \end{aligned}$ |

The units can be mounted into the $19^{\prime \prime}$ mounting chassis B8716 10, B8 71613 and B 871615 . The base plate of the power supplies serves as a side panel in the $19^{\prime \prime}$ mounting rack. One of the side panels of the mounting rack is therefore replaced by the base plate of the power supply.
${ }^{1}$ Full load ${ }^{2}$ Half load

## UNIVERSAL MODULAR POWER SUPPLIES

## TRANSISTORIZED POWER SUPPLY UNITS

A new series of power supply modules is being developed. Several modules can be assembled to a power supply unit to suit requirements of voltage (from 5 V up to 60 V ), current (up to 10 A ) and stability.

## Tentative data

| Internal resistance | $<5 \mathrm{~m} \Omega$ |
| :--- | :--- |
| Internal impedance at $500 \mathrm{kc} / \mathrm{s}$ | $<50 \mathrm{~m} \Omega$ |
| Ripple | $<1 \mathrm{mV}$ |
| Stability ratio | $1000: 1(10 \%$ input change gives |
|  | $0,01 \%$ change in output $)$ |
| Temperature coefficient | $<0,001 \%$ per deg. C |

The supply units can be mounted in standard 19" racks.

## DECADE SWITCHES

A few types of professional high-quality switch have been developed.

The following types are available:
FC21051 (Fig. 1)
Simple normal ten-position switch with two desks.
Colour code: yellow
FC21060 (Fig. 2)
Decade decoding switch, code 1.2.4.2. containing: a thumb-driven 10 -position switch with $0-9$ indication

a decoding circuit incorporated a negative gate with 4 inputs
Colour code: red.
FC21061 (Fig. 2)
Decade decoding switch, code 1.2.4.8. containing the same as type FC21060.

Colour code: grey
Under development:

## FC21062

12-position switch with two desks.

Fig. 1.

Fig. 2.

## DECADE SWITCHES

## Fixing

The switches can easily be mounted on front panels up to 2 mm thickness without tools or screws. Up to six switches can be clicked into a grey nylon mounting plate (see figure) which is mounted on the front panel. The output tags can be soldered directly into a 2 inch-grid printed-wiring board.

## Nylon fixing plates

Available for 1 up to and including 6 switches. Development type numbers: 1 switch FC00155 2 switches FC00156 3 switches FC00157 4 switches FC00158 5 switches FC00159 6 switches FC00160

0.5 A

1 A
$5 \times$ nominal load
$500 \mathrm{~V}_{\mathrm{dc}}$
$\mathrm{R}_{\mathrm{i}}>1 \mathrm{k} \Omega$ at 100 V
$\mathrm{R}_{\mathrm{c}}<25 \times 10^{-4}$
$\mathrm{C}_{\mathrm{p}}<15 \mathrm{pF}$ 10 mA
$>200,000$ full turns 250-750 grammes
$500 \mathrm{~V}_{\mathrm{dc}}$

In the microwave field many components are available, others are under development.
Due to the fact that the tubes, the ferrites, the magnets and all the necessary materials have been developed and are produced in the same factory, their quality and reliability are really outstanding. Components are available in a wide frequency range: about 400 to $40.000 \mathrm{Mc} / \mathrm{s}$.

1. Ferrite components as isolators, circulators, 3 -ports, 4 -ports, switches, etc.
2. Amplifiers and oscillators as well as power output stages.
3. Hardware as bends, twists, coaxial lines for waveguide transitions, tapers, etc.

As a rule the following guaranteed specification for isolators e.g. is given:
Insertion loss $<0.5 \mathrm{~dB}$
Attenuation $>30 \mathrm{~dB}$
VSWR over the whole band 1.05 and less than 1.02 over a bandwidth of $50 \mathrm{Mc} / \mathrm{s}$ around any centre frequency in the band. All the components have the standardized JAN, WR or IEC waveguides. IEC flanges are standard.

The finishing is silver-plated plus goldplated and in the standard G.P.O. (P.T.T.) grey colour.

Mixers, parametric amplifiers, masers and suchlike will soon be available.
The photographs show a few samples of units and components.

More types of integrated building bricks such as amplifiers plus isolators plus coaxial line-to-waveguide adaptor are also available.

For further details, technical advice etc. please contact the professional group of the Icoma division.

## MICROWAVE UNITS

## OTHER COMPONENTS FOR MICROWAVE EQUIPMENT

Apart from the microwave building bricks mentioned, a great variety of microwave components is available or under development, such as:

Loads (any waveguide) VSWR $<1.03$ (A); matchable short-circuit; transitions (coaxial to waveguide) VSWR about 1.10 ( $B$ and $C$ ); gas shutters VSWR $<1.03$ ( $D$ ); waveguide bends $E$ and $H$; quick-release waveguide clamps B873401 (E); tuning key for isolators and amplifiers K399619 (screw head 5.1 mm square) (F).
Moreover, under development: mixers; switches for up to $13500 \mathrm{Mc} / \mathrm{s}$; filters (tunable); parametric amplifiers and mixers, hybrids, attenuators, etc.

## LAB ORATORY MODEL OF AN S-BAND PARAMETRIC AMPLIFIER PLUS CIRCULATOR

Varactor diode
Overall noise figure . . . 3.2 dB
Bandwidth . . . . . . . 20-35 Mc/s
Pump frequency . . . . . $9000 \mathrm{Mc} / \mathrm{s}$
Pump power . . . . . . 5 mW
Tunable from . . . . . . 2700-3300 Mc/s by varying the pump frequency andlevel only.

These data are provisional.

## Sensitivity

54 dB at $1000 \mathrm{c} / \mathrm{s}$ with reference to $1\left(\mathrm{~N} / \mathrm{m}^{2}\right)^{2} / \mathrm{W}$; measured in combination with a suitable ear-piece and an artificial ear having a chamber volume of $6 \mathrm{~cm}^{2}$.

## Frequency response

A typical frequency response curve is shown in Fig. 3 indicating also the limits in between which the response curves are guaranteed.

## Impedance

$350 \Omega \pm 20 \%$ at $1000 \mathrm{c} / \mathrm{s}$.

## Main constructional features

Nicke!-plated brass case, rigid magnetic circuit and adequate protection against moisture and dust. Dimensions are given in Fig. 2.

## Weight

80 grammes

Fig. 1. Test circuit

Fig. 2

Fig. 3

## Sensitivity

$20 \mathrm{mV} / \mu \mathrm{B}$
at sound pressure of 80 phon and a frequency of $1000 \mathrm{c} / \mathrm{s}$.

## Frequency response

A typical frequency response curve is shown in Fig. 3, indicating also the limits in between which the frequency response curves are guaranteed.

## Resistance

$100 \Omega(70-150 \Omega)$ at approximately $\mathrm{I}=30 \mathrm{~mA}$.

## Stability

EMF generated at noise of 80 dB (absolute) will vary less than 2 dB if $1000 \mathrm{c} / \mathrm{s}$ sound pulses of 100 dB are superimposed.

## Main constructional features

Nickel-plated brass case; metal diaphragm; carbon chamber consisting of insulating ring, gold plated lower and upper electrodes. Excellent moisture protection. Dimensions are given in Fig. 2.

## Weight

35 grammes

## ULTRASONIC DELAY LINES

Ultrasonic delay lines provide storage of analogue and digital information for periods up to several milliseconds. The lines consist of a transmitting transducer, an acoustic transmission medium and a receiving transducer. The electrical input is converted into an ultrasonic wave which is propagated through the medium and then converted again into an electrical signal. The speed of the ultrasonic wave is slow compared with that of an electromagnetic wave, so that comparatively large delays can be accommodated in a convenient size.

Several types of delay lines are in our programme:

1. Fused quartz lines, acoustic bandwidth approximately 0.5 of the carrier frequency.

Standard carrier frequencies are e.g. 7, 15 and $30 \mathrm{Mc} / \mathrm{s}$.
Temperature coefficient of the delay: 70 parts per $10^{6}$ per ${ }^{\circ} \mathrm{C}$.
2. Mercury lines are important for frequencies above $20 \mathrm{Mc} / \mathrm{s}$.

Available in fixed and variable ( $25-330 \mu \mathrm{sec}$. e.g.) versions.
Temperature coefficient -3 parts per $10^{4}$ per ${ }^{\circ} \mathrm{C}$.
3. Wire lines for applications with multiple transducers and a large range of adjustment (by using torsional modes up to several milliseconds and storage capacity of over 1000 bits-equivalent to a bandwidth of approximately $1 \mathrm{Mc} / \mathrm{s}$ for a 1 ms line).
Temperature coefficient 10 parts per $10^{6}$ per ${ }^{\circ} \mathrm{C}$.

## DELAY MODULE

The YL2108 delay module contains an ultrasonic delay line and associated transistorised input and output electronics. It is suitable for use with existing circuit block systems or is directly adaptable to fit other requirements; either n-p-n or p-n-p logic systems are catered for in the input, output and power supply requirements.

The delay is within the range $100 \mu$ s to $3200 \mu$ s as specified by the customer, with a fine adjustment in value by a preset control. For lines with the shorter delay the maximum pulse repetition frequency is $400 \mathrm{kc} / \mathrm{s}$ falling to $250 \mathrm{kc} / \mathrm{s}$ for the $3200 \mu \mathrm{~s}$ delay line.

The input circuit of the unit is a voltage-level discriminator with the trigger level set at 1.5 V . Negative-going edges in the range 20-350 nanoseconds per volt will result in reliable operation. The negative-going output pulse is of constant amplitude and the width is preset to one of three values dependent on the p.r.f. in use.

Pulse Repetition Frequency:. . $400 \mathrm{kc} / \mathrm{s}$ maximum for short

Temperature Range: . . . . . $-10^{\circ} \mathrm{C}$ to $+60^{\circ} \mathrm{C}$
Temperature Coefficient . . . From -5 parts per million deg.C

Input Drive Current: . . . . . Not to exceed 25 mA peak, 5 mA average over any 50 ms period
Output Signal Amplitude: . . . Unloaded 6.5 V nominal from a source impedance of $700 \Omega$
Output Pulse Width: . . . . . $1.3 \mu \mathrm{~s}, 400 \mathrm{kc} / \mathrm{s}$
of delay:

Supply: for long lines, to +50 parts for very short delay lines
$12 \mathrm{~V} \pm 5 \%$, including ripple load current 100 mA at maximum frequency falling to 50 mA quiescent

Pulse width Max. P.R.F.

## FERRITE RECORDING HEADS

For these heads a very high-density ferrite is used. The gaps are made by a glass bonding technique which guarantees sharply defined gap edges. This technique gives also the possibility of making multitrack heads with well-aligned gaps.
Ferrite recording heads offer the advantage of low losses and great wear resistivity.
The heads are potted in a metal case. The coil connections as well as an earthconnection to prevent static charge of the head are accessible at the under side; they are designed as solder tags.

Standard gap lengths are $2,3.5,6.5,12$, 20 microns. The gap height depends on the application and can be for instance 50-200 microns.

A range of heads in the following fields is available: Audio, analog data recording, digital recording with either single or dual gap per track, video, floating heads for drums and discs, modulating heads in static recording. All these heads are available in single or multitrack version, for instance:

1/4 inch 1, and 2 tracks, also $1-3$ or 2-4 stereo
$1 / 2$ inch $3,4,7$ and 8 tracks
1 inch 7 (or $7+1$ ) and 17 tracks

## Record-head 43220204027

| modulation for full modulation gaplength | $\begin{aligned} & 4.5 \mathrm{~mA} \pm 1 \\ & 0.85 \mathrm{~mA} \pm 0.1 \\ & 6.0 \mu \mathrm{~m}+1-0 \end{aligned}$ |

## ELECTROLYTIC CAPACITORS

## INTRODUCTION

The electrolytic capacitors listed can be subdivided into the following groups according to their principal applications.

## 1. wet aluminium capacitors

1a. the general-purpose programme
C426 series - miniature type
C437 series - small type
C431 series - large type
1 b. the extended-voltage programme
C436 series - small type
C433 series - large type
AC series - large type

## 2. wet long-life capacitors <br> C428 series - small aluminium type <br> C432 series - large aluminium type <br> C420 series - ultra small tantalum type

3. solid aluminium and tantalum capacitors

C415 series - solid aluminium type
C421 series - solid tantalum type
Group 1a: the general-purpose programme
This programme includes a large group of capacitors for low working voltages in an extended capacitance range. In connection with the low working voltages and high capacitance values these types will fulfil all requirements of transistorised equipment. The permissible ambient temperature range is -40 to $+70^{\circ} \mathrm{C}$, which is suitable for these applications.

The economy range of the C426 series consists of types with the same capacitance and voltage range as the standard C426 series but in can sizes 4 and 6 only. Compared to smaller types they have better characteristics, which make this range preferable for those cases where utmost miniaturisation is not required.

Group 1b: the extended voltage programme
These types can be used if high working voltages are required and also at higher working temperatures up to $85^{\circ} \mathrm{C}$ (C436, C433 series). Moreover in this range different mechanical versions are available.

## Group 2: wet long-life capacitors

These types have a special construction resulting in better properties such as long service life and high reliability for application in computers, telephone and other industrial equipment, where these properties are of primary interest.
The C428 series have a limited capacitance range and are therefore specially suitable for coupling and decoupling applications.
The C432 series have very high capacitance values and are therefore specially suitable for use in power supplies of professional equipment. The admissible ambient temperature range is -40 to $+70^{\circ} \mathrm{C}$.
A special group of capacitors which, regarding their properties, can also be arranged in group 2, are the miniature wet tantalum types: the C420 series. These types combine excellent properties, long service life and reliability with ultra small dimensions. Typical applications are hearing aids and other very small transistorized equipment. The admissible ambient temperature range is -40 to $+55^{\circ} \mathrm{C}$.

## ELECTROLYTIC CAPACITORS

INTRODUCTION
Group 3: solid aluminium and tantalum capacitors
The C415 series are of cheap design and have good properties, the most important being unlimited service life, high reliability, high stability; they are tested according to MIL-STD202. The permissible ambient temperature ranges from -80 to $+85^{\circ} \mathrm{C}$ at full voltage.
The C421 series have about the same properties with very small dimensions. They are therefore very suitable for miniaturised professional and military equipment. The permissible ambient temperature range is -40 to $+85^{\circ} \mathrm{C}$ ( $125^{\circ} \mathrm{C}$ with derated voltage). C421 capacitors are conform MIL-C26655B, styles CS12/CS13.

SELECTION GUIDE

[^9]
## C426 series - ELECTROLYTIC CAPACITORS

## MINIATURE TYPE, FOR GENERAL PURPOSES (ECONOMY RANGE)

The economy range covers the whole capacitance and voltage range of the standard C426 series, but in can sizes 4 and 6 only, which offers the cheapest possible solution. Moreover, these capacitors offer, compared to smaller types:
(a) better low-temperature characteristics;
(b) lower losses and impedances;
(c) longer service life and higher reliability.
They are therefore preferable in all cases where utmost miniaturisation is not required.
These capacitors are designed for operation between -40 and $+70^{\circ} \mathrm{C}$. They may also operate at $85^{\circ} \mathrm{C}$ for 12 hours per 24 hours.

## ELECTROLYTIC CAPACITORS - C426 series

MINIATURE TYPE, FOR GENERAL PURPOSES (ECONOMY RANGE)

## Impedance graphs

The impedance at e.g. $100 \mathrm{kc} / \mathrm{s}$ rises at low temperatures, which has to be considered when choosing a capacitor for a given application.
Typical impedance/temperature curves for the different can sizes are given below. The maximum values at $20^{\circ} \mathrm{C}$ and $100 \mathrm{kc} / \mathrm{s}$ are stated in the table.

Can size 4

## Can size 4

Can size 4

Can size 6

## C426 series - ELECTROLYTIC CAPACITORS

MINIATURE TYPE, FOR GENERAL PURPOSES

These capacitors are specially suitable for coupling and decoupling in miniaturised electronic equipment, such as transistorised pocket radio receivers, personal tape recorders and similar applications.
They are available in an insulated version with axial leads for conventional wiring and in a version for vertical mounting on printed wiring boards. The two smallest cans are also available in a non-insulated version with axial leads.

For applications in which utmost miniaturisation is not required we refer to the economy range (see preceeding pages).

## ELECTROLYTIC CAPACITORS - C426 series

## MINIATURE TYPE, FOR GENERAL PURPOSES

## Impedance graphs

The impedance at e.g. $100 \mathrm{kc} / \mathrm{s}$ rises at low temperatures, which has to be considered when choosing a capacitor for a given application.
Typical impedance/temperature curves for the different can sizes are given below. The maximum values at $20^{\circ} \mathrm{C}$ and $100 \mathrm{kc} / \mathrm{s}$ are stated in the table.

## Can size 1

## C437 series - ELECTROLYTIC CAPACITORS

## SMALL TYPE, FOR GENERAL PURPOSES

Maximum d.c. working voltage
These capacitors are specially suitable for coupling and decoupling in small transistorised equipment, such as portable radio receivers and personal recorders, and similar applications where high capacitance values are needed.
This new range of electrolytic capacitors, to be considered as an extension of the miniature C426 series, is characterised by interesting features: small size, high capacitance values and a long service life.
The sturdy mechanical construction - with welded terminals - ensures long and reliable operation. Low leakage currents could be achieved by employing highly purified material and by a carefully controlled manufacturing process.

SMALL TYPE, FOR GENERAL PURPOSES

## C431 series - ELECTROLYTIC CAPACITORS

## LARGE TYPE, FOR GENERAL PURPOSES

This range of high-capacitance electrolytic capacitors has been developed for coupling and decoupling applications in mains-operated transitorised equipment, and their design makes them particularly suitable for television receivers. In applications of this type high alternating currents are often involved; therefore, special attention has been given to the current rating of these capacitors.
A special construction guarantees a very low equivalent series resistance which makes them suitable for high ripple currents.
The capacitors are insulated, whereas a noninsulated version is available upon request. The five can sizes cover a range of capacitance of from 320 to $25000 \mu \mathrm{~F}$ with working voltages between 4 and $64 \mathrm{~V}_{\mathrm{dc}}$.
Double versions are available in can size 7, triple versions in can sizes 9 and 10 .
The construction is such that one section may be loaded with a very high ripple current, whereas the ripple voltages of the other sections, due to parasitic capacitances, remain very low.

Maximum d.c. working voltage

Fig. 2

## Mounting brackets

To facilitate vertical mounting, a series of rigid brackets made of cadmium-plated steel are available. They can easily be slid over the capacitor and then fixed to it with a bolt and nut. They are provided with two mounting lugs and, except the smallest version, with two supports to give stability in the cross direction.
Four types are available, one for each can diameter of the capacitor range. They are delivered without bolts and nuts.

## C431 series - ELECTROLYTIC CAPACITORS

## LARGE TYPE, FOR GENERAL PURPOSES

Series resistance of a 16-64 V single capacitor as a function of frequency.

Series resistance of a $16-64 \mathrm{~V}$ double capacitor as a function of frequency

Series resistance of a 16-64 V triple capacitor as a function of frequency

Dissipation factor of a single capacitor as a function of temperature

Dissipation factor of a double capacitor as a function of temperature

## ELECTROLYTIC CAPACITORS - C431 series

LARGE TYPE, FOR GENERAL PURPOSES

## Impedance graphs

The impedance at e.g. $100 \mathrm{kc} / \mathrm{s}$ rises at low temperatures, which has to be considered when choosing a capacitor for a given application.
Typical impedance/temperature curves for the different can sizes are given below. The maximum values at $20^{\circ} \mathrm{C}$ and $100 \mathrm{kc} / \mathrm{s}$ are stated in the table.

Can size 7

Can size 9

Can size 10

## C436 series - ELECTROLYTIC CAPACITORS

SMALL TYPE, FOR HIGH AND LOW VOLTAGES

Due to the high working voltages and permissible temperature these small size capacitors are suitable for decoupling in all kind of tube equipment such as radio and television receivers and similar applications. They have been designed for operation between -40 and $+70^{\circ} \mathrm{C}$.
However, the capacitors with d.c. working voltages up to and including 100 V may also operate at $+85^{\circ} \mathrm{C}$ for 12 hours per 24 hours provided that the applied d.c. voltage is not higher than $64 \%$ of the nominal working voltage.

Max. d.c. working voltage

## SMALL TYPE, FOR HIGH AND LOW VOLTAGES

## Impedance graphs

The impedance at e.g. $100 \mathrm{kc} / \mathrm{s}$ rises at low temperatures, which has to be considered when choosing a capacitor for a given application.
Typical impedance/temperature curves for the different can sizes are given below. The maximum values at $20^{\circ} \mathrm{C}$ and $100 \mathrm{kc} / \mathrm{s}$ are stated in the table

Can size 02

Can size 01

Can size 03

## LARGE TYPE, FOR HIGH AND LOW VOLTAGES

Due to the high working voltages and high permissible temperature these capacitors are suitable for use in power supplies of tube equipment.
There are ten can sizes and three mechanical versions.
(a) Capacitors with soldering terminals acting as positive and negative terminals either suspended in the wiring of the equipment or fixed by means of a bracket.
(b) Capacitors in a can the edge of which is provided with three or four twistable terminals for fixing the capacitor and acting as negative terminals. One or two soldering tags on the seal serve as positive terminals.
(c) Printed-wiring capacitors. The can is equipped with a built-in metallic base which contains three or four soldering terminals for the attachment and acting as negative terminals. One or two pins through the seal serve as positive terminals.

These capacitors are not insulated. Insulated versions are available upon request.

Capacitors in can size 6 are also available in can size 6T

## Composition of the type number $\quad$ C441GR/

Capacitors are delivered with a nut, insulating ring, and ring provided with a soldering lug.

## Special series - ELECTROLYTIC CAPACITORS

## LARGE TYPE, FOR HIGH VOLTAGES

## High ripple-current capacitors

The capacitors can stand extra high ripple currents. In the case of multiple versions, one section (the one for the high ripple currents) has a separate cathode connection.
They are mainly used as smoothing capacitors in television receivers.
Special attention is drawn to the quadruple types which are ideal for the above application.

## High discharge-current capacitors

For applications in which the capacitor is discharged periodically in short periods of time, special construction measures have to be taken. A few types, designed for special purposes, are available.

## Bipolar electrolytic capacitors

Contrary to normal electrolytic capacitors, bipolar capacitors may be loaded continuously with small a.c. voltages or with reversed voltages for short periods of time. A d.c. voltage may be applied in either direction. They are used e.g. in voltage-doubler circuits, in single-ended push-pull output stages or as phasing capacitors with small a.c. motors.

## Octal-base capacitors

In case a very quick replacement of the electrolytic capacitor should be possible, octal-base capacitors are to be used.

## C428 series - ELECTROLYTIC CAPACITORS

SMALL LONG LIFE TYPE (Supersedes C427)

This range of electrolytic capacitors has been specially developed for industrial apparatus where long service life and high reliability are essential, e.g. computors, telecommunication and telephone equipment.
High grade materials, an extra reserve of electrolyte and close quality control during manufacture ensure that these capacitors have a life expectancy far superior to normal grade electrolytic capacitors.

LARGE LONG LIFE TYPE

## Impedance graphs

The impedance at e.g. $100 \mathrm{kc} / \mathrm{s}$ rises at low temperatures, which has to be considered when choosing a capacitor for a given application.
Typical impedance/temperature curves for the different can sizes are given below. The maximum value at $20^{\circ} \mathrm{C}$ and $100 \mathrm{kc} / \mathrm{s}$ is $0.1 \Omega$.

## C415 series - ELECTROLYTIC CAPACITORS

## SMALL SOLID ALUMINIUM TYPE

Solid electrolyte capacitors offer great advantages over wet types as regardsservice life, reliability, stability during life, temperature range etc. They are therefore preferable for all kinds of professional and military equipment.
The C415-type is the only solid-electrolyte aluminium capacitor available now.
Although its dimensions are larger than those of solid tantalum types, the electrical performance is almost the same.

Maximum d.c. working voltage.

## C415 series - ELECTROLYTIC CAPACITORS

## SMALL SOLID ALUMINIUM TYPE

## Test specification

## General

The capacitors considered have been subjected to extensive electrical, climatic and mechanical tests. As no standard test specification for solid-electrolyte aluminium capacitors exists up till now, a special specification has been made up from the severest tests that could be found in existing specifications. The most important tests are given below.

Life test
The capacitors are submitted to a 5000 -hours life test at full voltage and a temperature of $85^{\circ} \mathrm{C}$. After the test the capacitance, leakage current and impedance shall not exceed the values listed in columns 4,5 and 8 . (See table page C49).
The maximum change in capacitance shall not exceed $5 \%$ of the initial measurements. The leakage current shall not exceed the initial leakage current requirements. The impedance shall not exceed the initial requirements.

## Moisture resistance

a. The capacitors are tested in accordance with test C, severity IV of IEC publication 68-2 (56 days at $40^{\circ} \mathrm{C}$ and $90-95 \%$ r.h.).
After the test the capacitance, leakage current and impedance shall not exceed the values listed in columns 4,5 and 8 . The change in capacitance shall not be more than $5 \%$ of the initial value, d.c. leakage and impedance shall not exceed the initial requirements.
b. The capacitors are tested in accordance with method 106 of MIL-STD-202.

After the test the capacitance shall not change more than $5 \%$ of the initial value, d.c. leakage and impedance shall not exceed the initial requirements.

## Temperature and immersion cycling

The capacitors will withstand temperature and immersion cycling as per MIL-STD-202, Methods 102 and 104 respectively (including 5 cycles between $-55^{\circ} \mathrm{C}$ and $+125^{\circ} \mathrm{C}$ ). After these tests, the capacitance shall not change more than $5 \%$ of the initial value, d.c. leakage and impedance shall not exceed the initial requirements.

## Charge and discharge

The capacitors may be charged and discharged unrestrictedly. In particular they may be submitted to test 3.2 .8 of the specification CCTU $02-10$ of 15.11 .1962. The capacitors are subjected to $10^{6} \mathrm{cycles}$, each cycle comprising a charge and discharge time of 0.5 sec ., and an RC-time of 0.1 sec .
After the test the change in capacitance shall not exceed $3 \%$ of the initial value.

## Storage

The capacitors may be stored for any length of time. After a storage of one year at a temperature below $40^{\circ} \mathrm{C}$ the change in capacitance shall not exceed $5 \%$ of the initial value, d.c. leakage and impedance shall not exceed the initial requirements.

Example. The type number of a $15 \mu \mathrm{~F} / 20 \mathrm{~V}$ capacitor is C421AM/EP15.

## C421 series - ELECTROLYTIC CAPACITORS

## SOLID TANTALUM TYPE

## Test specification

## Load test

After 2.000 hours of loading at $65^{\circ} \mathrm{C}$ and the full rated voltage, the capacitance and leakage current are measured acc. to MIL specs. The capacitance shall not have changed by more than $10 \%$ of the initial value, the leakage current shall not exceed the listed value by more than $25 \%$.

Shock and vibration
The capacitors shall withstand an 8 -hour vibration test as per MIL-STD-202, method 204 test frequency $55-2,000 \mathrm{c} / \mathrm{s}$.
Temperature and immersion cycling
After a temperature and immersion cycling test as per MIL-STD-202 (methods 102 and 104 respectively) the capacitance, leakage current and dissipation factor are measured acc. to MIL specs. The capacitance shall not have changed by more than $5 \%$ of the initial value; the leakage current and the dissipation factor shall not exceed the listed values.
Salt spray
After a test as per MIL-STD-202, method 101, the capacitors shall show no corrosion or harmful effects.

## Moisture resistance

After a test as per MIL-STD-202, method 106, the capacitance, leakage current and dissipation factor are measured acc. to MIL specs. The capacitance shall not have changed by more than $5 \%$ of the initial value; the leakage current and the dissipation factor shall not exceed the listed values.

## Ripple current

The capacitors may be operated at a superimposed a.c. ripple voltage, provided that this does not cause the limit of the heat dissipation to be exceeded. This limit depends on the ripple frequency, ambient temperature and capacitance.
The ripple current $I_{\mathrm{r}}$, permissible at $25^{\circ} \mathrm{C}$ and $100 \mathrm{c} / \mathrm{s}$, is calculated from the equation $\mathrm{I}_{\mathrm{r}}=2 \pi f E_{\mathrm{r}} \mathrm{C}$, where $f=$ the ripple frequency in $\mathrm{c} / \mathrm{s} ; E_{\mathrm{r}}=$ the ripple voltage (see graph 1 ); $C=$ the capacitance in F .
The ripple voltage $E_{r}$, permissible at any temperature $T$ and frequency $f$, is calculated by means of the graphs 1-2 and the equation $E_{r}=E_{100} \times E_{25} / R_{r}$, where
$E_{r}=$ the ripple voltage at $25^{\circ} \mathrm{C}$ and $100 \mathrm{c} / \mathrm{s}$, see fig. 1.
$E_{100}=$ the ripple voltage at $\mathrm{T}^{\circ} \mathrm{C}$ and $100 \mathrm{c} / \mathrm{s}$, see fig. 1.
$E_{25}=$ the ripple voltage at $25^{\circ} \mathrm{C}$ and $f \mathrm{c} / \mathrm{s}$. see fig. 2.

## Colour code

For example, a $0.64 \mu \mathrm{~F} / 25 \mathrm{~V}$ tantalum capacitor is marked as follows:

$$
\begin{aligned}
\mathrm{I} & =\operatorname{grey}(6.4 \mu \mathrm{~F}) \\
\mathrm{II} & =\text { goid }(x 0.1) \\
\mathrm{III} & =\text { green }(25 \mathrm{~V})
\end{aligned}
$$

| colour | $I$ <br> $(\mu \mathrm{~F})$ | $I I$ <br> (multiplicand of I) | $I I I$ <br> $(V)$ |
| :--- | :--- | :---: | :---: |
| black | 1 | 1 | 2.5 |
| brown | 1.25 | 10 | 4 |
| red | 1.6 | 100 | 6.4 |
| orange | 2 | 1000 | 10 |
| yellow | 2.5 | - | 16 |
| green | 3.2 | - | 25 |
| blue | 4 | - | - |
| violet | 5 | - | - |
| grey | 6.4 | - | - |
| white | 8 | - | - |
| silver | - | 0.01 | - |
| gold | - | 0.1 | - |

Composition of the type number $\quad \mathbf{C 4 2 0} \mathrm{AN} /$

Example: The type number of a $10 \mu \mathrm{~F} / 10 \mathrm{~V}$ capacitor is C420AN/D10

Maximum leakage current at $20^{\circ} \mathrm{C}$ after 5 minutes is $1 \mu \mathrm{~A}$ for all types.
${ }^{1}$ Maximum permissible ripple current at $100 \mathrm{c} / \mathrm{s}$
${ }^{2}$ Maximum impedance at $20^{\circ} \mathrm{C}$ and $100 \mathrm{kc} / \mathrm{s}$

## ELECTROLYTIC CAPACITORS - C420 series

## ULTRA SMALL WET TANTALUM TYPE

## Impedance graphs

The impedance at e.g. $100 \mathrm{kc} / \mathrm{s}$ rises at low temperatures, which has to be considered when choosing a capacitor for a given application.
Typical impedance/temperature curves for the different can sizes are given below. The maximum values at $20^{\circ} \mathrm{C}$ and $100 \mathrm{kc} / \mathrm{s}$ are stated in the table.

Can size 1

Can size 2

Can size 3

## C280 series - METALLISED POLYESTER CAPACITORS

## FLAT FOIL TYPE

## Permissible overvoltage:

Special attention is drawn to the fact that the allowed $40 \%$ overvoltage for the C280AE range ( 250 V ) permits these capacitors to be employed instead of previously used 400 V capacitors in anode and screen grid circuits.

These capacitors are designed primarily for use as coupling and decoupling capacitors for electronic circuits employing printed wiring.
Due to the almost negligible temperature dependency they offer in many cases essential advantages over ceramic disc capacitors.
The dielectric material used in this range of capacitors is metallised polyethyleneterephtalate for the $250 \mathrm{~V}_{\text {de }}$ types and metallised polycarbonate for the $400 \mathrm{~V}_{\mathrm{dc}}$ and $630 \mathrm{~V}_{\mathrm{dc}}$ types.

Specification. For specification and characteristics see pp. C66-C69.

Composition of the type number C280.

|  | dielectric |
| :--- | :--- |
| $\mathrm{A}=$ polyethyleneterephtalate | $\left(250 \mathrm{~V}_{\mathrm{dc}}\right)$ |
| $\mathrm{C}=$ polycarbonate $\left(400 \mathrm{~V}_{\mathrm{dc}}\right.$ and $\left.630 \mathrm{~V}_{\mathrm{dc}}\right)$ |  |
| working voltage |  |

## capacitance code

capacitance tolerance

$$
\begin{aligned}
& A= \pm 10 \% \\
& P== \pm 20 \%
\end{aligned}
$$

$E=250 \mathrm{~V}_{\mathrm{dc}} ; F=400 \mathrm{~V}_{\mathrm{dc}} ; G=630 \mathrm{~V}_{\mathrm{dc}}$

Example: The type number of a $0.033 \mu \mathrm{~F} / 400 \mathrm{~V}$ capacitor with a dielectric of polycarbonate, tolerance $\pm 10 \%$, is C280CF/A33K.

Temporary the lead length may be longer than the specified length of 12 mm .

Intermediate values according to the E12 range are available on request. The dimensions are identical to those of the next higher value in the standard E6 range. The capacitance tolerance is either $\pm 10 \%$ or $\pm 20 \%$. The preferred tolerance is $\pm 20 \%$ up to and including $0.22 \mu \mathrm{~F}$ and $\pm 10 \%$ from $0.33 \mu \mathrm{~F}$ onwards.

## C281 series - METALLISED POLYESTER CAPACITORS

## MOULDED TYPE

## Permissible overvoltage:

Special attention is drawn to the fact that the allowed $40 \%$ overvoltage for the C281AB range ( 250 V ) permits these capacitors to be employed instead of previously used 400 V capacitors in anode and screen grid circuits.

These capacitors are designed for use as bypass and general-purpose capacitors in electronic equipment, both in the entertainment field and for industrial purposes. The high permissible a.c. voltage makes these types also appropriate for use as anti-interference capacitor in small electric appliances. The throughout rectangular shape of these capacitors renders them most suitable for wobble-free mounting on printed-wiring boards, either upright or level. The dielectric material used in this range of capacitors is metallised polyethyleneterephtalate for the 250 V dc types and metallised polycarbonate for the $400 \mathrm{~V}_{\mathrm{dc}}$ and $630 \mathrm{~V}_{\mathrm{dc}}$ types.

Specification. For specification and characteristics see pp. C66-C69.

Example: The type number of a $2.2 \mu \mathrm{~F} / 250 \mathrm{~V}$ capacitor with a dielectric of polyethyleneterephtalate, tolerance $20 \%$, is $\mathrm{C} 281 \mathrm{AB} / \mathrm{P} 2 \mathrm{M} 2$.
${ }^{1}$ Since the autumn of 1965 the $\mathrm{V}_{\mathrm{dc}}$ series with polyethyleneterephtalate dielectric, type C281AD, has been replaced by a new $400 \mathrm{~V}_{\text {dc }}$ series with polycarbonate dielectric, type C281CD, with greatly reduced dimensions.

## 532. series - PAPER CAPACITORS FOR DIRECT CURRENT

## INSULATED TUBULAR TYPE

These capacitors are meant for special applications in radio and television circuits such as booster capacitors.

## Composition of the type number 532.

$$
\begin{aligned}
A & = \pm 10 \% \\
P & = \pm 20 \%
\end{aligned}
$$

Example: The type number of a $2200 \mathrm{pF} / 600 \mathrm{~V}$ capacitor, tolerance $20 \%$, is $5326 \mathrm{P} / 2 \mathrm{~K} 2$.

On request $600 \mathrm{~V}_{\text {dc }}$ types with intermediate values according to the E12 series can be supplied.

Types the dimensions of which are given above the dividing lines have a wire diameter of 0.8 mm ; the other types have a wire diameter of 1 mm .

## C101/C102 series - PAPER CAPACITORS FOR DIRECT CURRENT

## TUBULAR TYPE IN ALUMINIUM CASING

These cylindrical capacitors with impregnated paper dielectric are used in a great variety of equipment (e.g. measuring apparatus) and installations (e.g. for telecommunications) where severe demands have to be met as regards quality, dependability and durability.
The extra-sealed version C102 is in accordance with R.C.S. specification 11, class H 1 . These capacitors are thus excellently suited for use at high altitudes and under the most adverse climatic conditions.

## Composition of the type number C101../...

| construction <br> $A=$ non-insulated $; C=$ insulated working voltage | $\longrightarrow$ capacitance code <br> $\rightarrow$ capacitance tolerance $P= \pm 20 \% \text { for } C<3300 \mathrm{pF}$ |
| :---: | :---: |
| $\begin{array}{r} A=180 \mathrm{~V}_{\mathrm{dc}} ; B=350 \mathrm{~V}_{\mathrm{dc}} ; C=700 \mathrm{~V}_{\mathrm{dc}} ; \\ \mathrm{D}=1000 \mathrm{~V}_{\mathrm{dc}} \end{array}$ | $A= \pm 10 \%$ for $\mathrm{C} \geqslant 3300 \mathrm{pF}$ |

Example: The type number of a $8200 \mathrm{pF} / 700 \mathrm{~V}$ capacitor, non-insulated, is $\mathrm{C} 101 \mathrm{AC} / \mathrm{A} 8 \mathrm{~K} 2$.
The same composition of the type number applies to the C 102 series; however, the C 102 version can be supplied only as an insulated type.

## PAPER CAPACITORS FOR DIRECT CURRENT - C101/C102 series

## TUBULAR TYPE IN ALUMINIUM CASING

C101 - Insulated or non-insulated

Note. For the insulated types the dimensions D and L should be increased by 1.4 mm

All types the dimensions of which are given below the dividing lines, are wound with extended foils and are also suitable for low working voltages (smaller than 1 mV ).

## 826.. series - PAPER CAPACITORS FOR DIRECT CURRENT

TUBULAR TYPE IN CERAMIC CASING FOR HIGH VOLTAGES

These capacitors are intended for high-voltage d.c. applications. Due to their hermetic sealing they are proof against atmospheric influences for an indefinite length of time. They are suited for use at high altitudes, as well as in polar and tropical regions.
The earthing end of the capacitor is marked with a silver-coloured dot ( $A$ in the dimensional drawing).

## PAPER CAPACITORS FOR DIRECT CURRENT

## HIGH-YOLTAGE TYPE IN INSULATED CASING

These high-tension capacitors are used e.g. in apparatus for X-ray research, nuclear research and testing of high-voltage installations. In these applications the capacitors may be charged either continuously by a direct current (e.g. in a cascade generator) or only during a short period of time and then discharged again (e.g. in a pulse generator). Various other modes of operation are possible.

## Types and construction

In view of the many charging conditions when have to be covered, the capacitors are classified into three groups:
(a) for continuous d.c. operation;
(b) for intermittent d.c. operation ( $30 \%$ averaged over 24 hours);
(c) for surge operation (the maximum direct voltage is applied only for short periods, in the order of minutes or even less).

The paper dielectric has been chosen so as to combine optimum performance under the relevant operating conditions with minimum dimensions and low price.
The casing is composed of a high-grade synthetic pot enlarged, if necessary by a number of rings screwed onto this pot to obtain the total volume required.
The top is closed by a cast-iron cover which is connected to one side of the capacitor element, the other connecting terminal being present in the centre of the bottom. For some types the pot and extension rings are provided with flanges of the same material so that the distance between the two terminals is increased and a higher working voltage can be applied. There are two standard diameters of the casing.

## PAPER CAPACITORS FOR DIRECT CURRENT

## HIGH-VOLTAGE TYPE IN INSULATED CASING

In the following table the maximum permissible direct voltage and the maximum static energy content expressed in terms of joules are given for the various combinations of pot and rings either with or without flanges and for the three different modes of operation.

| max. working voltage (kV) | output for the different types (Wsec) |  |  | $\begin{gathered} \text { number } \\ \text { of } \\ \text { rings } \end{gathered}$ | construction according to fig. | $\begin{aligned} & \text { dimensions }(H) \\ & \text { in } \mathrm{mm} \end{aligned}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | continuous operation | intermittent operation | surge operation |  |  |  |
| 20 | 15 | 50 | 65 | 1 | 1 | 145 |
| 30 | 15 | 50 | 65 | 1 | 2 | 145 |
| 45 | 40 | 135 | 200 | 2 | 1 | 255 |
| 60 | 40 | 135 | 200 | 2 | 2 | 255 |
| 60 | 155 | 525 | 760 | 1 | 3 | 245 |
| 75 | 60 | 220 | 300 | 3 | 1 | 365 |
| 75 | 155 | 525 | 760 | 1 | 4 | 245 |
| 100 | 60 | 220 | 300 | 3 | 2 | 365 |
| 100 | 80 | 310 | 400 | 4 | 1 | 475 |
| 120 | 320 | 1100 | 1850 | 2 | 3 | 465 |
| 150 | 80 | 310 | 400 | 4 | 2 | 475 |
| 150 | 100 | 400 | 500 | 5 | 1 | 585 |
| 150 | 320 | 1100 | 1850 | 2 | 4 | 465 |
| 180 | 530 | 1800 | 2800 | 3 | 3 | 685 |
| 200 | 100 | 400 | 500 | 5 | 2 | 585 |
| 200 | 120 | 500 | 600 | 6 | 1 | 695 |
| 225 | 530 | 1800 | 2800 | 3 | 4 | 685 |
| 250 | 120 | 500 | 600 | 6 | 2 | 695 |
| 250 | 140 | 590 | 700 | 7 | 1 | 805 |
| 300 | 140 | 590 | 700 | 7 | 2 | 805 |

The static energy content is calculated in joules as:
$\frac{1}{2}$ CU $^{2}$, where $C=$ capacitance in microfarads
$\mathrm{U}=$ direct working voltage in kilovolts.
The table serves only as a guidance to illustrate the possibilities of this high-voltage capacitor programme. Quotations can be made only if full details of the requirements are stated, viz.:

1. capacitance;
2. maximum working voltage;
3. maximum temperature if higher than $40^{\circ} \mathrm{C}$;
4. mode of operation (unless continuous d.c. operation is required):
A. for intermittent d.c. operation; average number of operating hours per day;
B. for surge operation: a. discharge time or discharge frequency; b. repetition frequency;
5. any other information that may be of value for the design of the capacitor.

## PAPER CAPACITORS FOR DIRECT CURRENT - B8 002. .series

TYPE FOR INTERFERENCE SUPPRESSION IN MOTOR CARS

These tropic proof metallised paper capacitors have been developed for suppressing interference from various electrical car accessories.
Because of the feed-through type of construction, the inductance of these capacitors is very low as is required for use in short-wave and f.m. car radios.
The capacitors consist of a low-inductively wound and impregnated strip of paper upon which a very thin film of metal has been deposited. It is contained in a cylindrical aluminium can (A) having a hollow screw-base with a mounting nut (B). Both ends of the can are sealed with an impermeable layer of synthetic resin, and provided with a terminal nut (C) and a spring washer.

| type number. | B800203 | B800202 |
| :---: | :---: | :---: |

| D . . . . . . . . . (mm) | 21 | 23 |
| mounting bracket | B1 02006 | B1 02007 |

Impedance at $100 \mathrm{Mc} / \mathrm{s}$ can be calculated from the series resistance $R$ and the reactance $X$ given in the table.

## PAPER CAPACITORS FOR ALTERNATING CURRENT

TYPE FOR INTERFERENCE SUPPRESSION IN ELECTRICAL APPLIANCES

These capacitors are widely used for eliminating radio and television interferences, caused by small motor-operated tools, household appliances such as vacuum cleaners, washers, refrigerators, kitchenaids, and by gas-discharge lamps.

These capacitors are specially designed for ballasts of luminous-discharge lamps but are also extensively used with single-phase asynchronous motors, and for power-factor correction in low-power devices. They represent the latest stage in the development of paper capacitors in all-metal cans for low a.c. powers

## Type Approvals

A large part of our capacitor programme has been approved by official testing institutes:

| Belgium | - CEBEC |
| :--- | :--- |
| Denmark | - DEMKO |
| Germany | - VDE |
| Norway | - NEMKO |
| Sweden | - SEMKO |
| Switzerland - SEV |  |

Besides, our capacitors comply with the British BSI specification, and the relevant IEC and CEE recommendations. If required, detailed information is available.

## PAPER CAPACITORS FOR ALTERNATING CURRENT

## C126 SERIES - TYPE FOR POWER-FACTOR CORRECTION

These capacitors are used for raising the power factor of alternatingcurrent installations by neutralising or reducing the wattless current originating from inductive loads. Unfavourable power factors arise mainly from underloaded asynchronous motors, transformers (welding apparatus), induction furnaces, and so forth.

## Composition of the type number $\mathbf{C 1 2 6}$

$\begin{aligned} & \text { single-phase } A \\ & \text { three-phase } B \\ & \text { working voltage } \\ & \mathrm{A}=220 \mathrm{~V} \\ & \mathrm{~B}=380 \mathrm{~V} \\ & \mathrm{C}=440 \mathrm{~V} \\ & \mathrm{D}=500 \mathrm{~V}\end{aligned}$

[^24]MOULDED MIDGET TYPE

These mica capacitors are especially recommended for communications equipment, measuring instruments, military devices, etc. They can be mounted in the wiring of the apparatus and, owing to their insulated body and their flat shape, be placed close together or against a metal plate.

| working temperature range | $-40 /+85^{\circ} \mathrm{C}$ |
| :---: | :---: |
| temperature coefficient of the capacitance | $(0$ to +60$) \times 10^{-6} \mathrm{pF}$ per pF and |
| working voltage. | $500 \mathrm{~V}_{\text {dc }} \quad$ per ${ }^{\circ} \mathrm{C}$ |
| maximum capacitance drift during life . . for $\mathrm{C}>100 \mathrm{pF}$ | $\begin{aligned} & \pm 1 \% \\ & \pm 1 \mathrm{pF} \end{aligned}$ |
| test voltage during 1 minute | $1350 \mathrm{~V}_{\text {dc }}$ |

| losses $(\tan \delta)$ : parallel damping. . . . for $\mathrm{C}<40 \mathrm{pF}$ | $\geqslant 4 \mathrm{M} \Omega$ |
| at $1 \mathrm{Mc} / \mathrm{s}$. . . . . . for $\mathrm{C}=40-1000 \mathrm{pF}$ | $\leqslant 10 \times 10^{-4}$ |
| at $100 \mathrm{kc} / \mathrm{s}$. . . . . for $\mathrm{C}>1000 \mathrm{pF}$ | $\leqslant 7 \times 10^{-4}$ |
| climatic group number | 45/085/21 (IEC) |

## Composition of the type number 82057. <br> capacitance tolerance

$\mathrm{A}= \pm 10 \%^{1}$ for $\mathrm{C} \geqslant 22 \mathrm{pF}$
$B= \pm 5 \%$ for $C \geqslant 93 \mathrm{pF}$
$C= \pm 2 \%$ for $C \geqslant 100 \mathrm{pF}$
$D= \pm 1 \%$ for $C \geqslant 100 \mathrm{pF}$
$M= \pm 1 \mathrm{pF}$ for $\mathrm{C} \leqslant 91 \mathrm{pF}$

[^25]Example: The type number of a 1800 pF capacitor, tolerance $\pm 5 \%$ is $82057 \mathrm{~B} / 1 \mathrm{~K} 8$.

## MOULDED PRECISION TYPE

These mica capacitors are designed with the aim of obtaining optimum performance as regards accuracy, stability and low losses. Therefore, they are suitable for applications which impose the highest requirements in this respect, such as e.g. measuring, control and communications equipment. The programme contains six series of capacitors.

Example: The type number of a $10000 \mathrm{pF} / 500 \mathrm{~V}_{\text {de }}$ capacitor, tolerance $\pm 5 \%$, is $82059 \mathrm{~B} / 10 \mathrm{~K}$.

## B8 02000 series - MICA CAPACITORS

## BALANCING TELEPHONE CABLE TYPE

These capacitors have been specially designed for balancing the pairs of loaded telephone cables in order to reduce the cross-talk to a value below the permissible limit.
The capacitors are supplied either single, double or quadruple.
Single balancing capacitors consist of a midget mica capacitor which has been moulded in a reddish brown thermo-setting synthetic resin.
The capacitors are provided with two connecting wires of tinned copper ( $0.5 \mathrm{~mm} \varnothing$ ) having a length of about 180 mm which are, except for the last 30 mm , insulated with an uninflammable plastic ( 0.9 $\mathrm{mm} \varnothing$ ) see fig. 1. One wire (the one connected to the outer electrodes) is red, the other yellow. Double balancing capacitors (see fig. 2) are composed of two single units arranged according to fig. 3. Quadruple balancing capacitors (see fig. 4) are composed of four single units in a bridge arrangement according to fig. 5.
This application imposes the highest requirements regarding precision, stability, insulation resistance and resistance to moisture.

test voltage during 1 minute:

## BALANCING TELEPHONE CABLE TYPE

These capacitors are made as an extension of our range of cable-balancing mica capacitors B802000. They are polystyrene capacitors mounted in cylindrical aluminium casings and sealed with a synthetic resin. A double and a quadruple version is available, arranged as shown in fig. 1 and fig. 2 respectively.

| working temperature range . . . . . . . . . . . . . . . . . . . . . . . . . . . |

## POLYSTYRENE CAPACITORS - C295 series

## TUBULAR MOULDED TYPE

These capacitors are very suitable for use in tuned circuits and filters of electronic equipment of all kinds, especially of carrier telephony equipment where high requirements are imposed as regards precision, stability and low losses at high frequencies. The fairly small negative temperature coefficient is advantageous for most applications.

They can be incorporated in the wiring of the equipment and are also suitable for vertical mounting on printed-wiring boards, the length of connection leads always being sufficient.

## Composition of the type number $\mathbf{C} 295 \mathrm{~A}$.

$$
\begin{array}{ll}
\mathrm{H}=63 \mathrm{~V}_{\mathrm{dc}} & \mathrm{~A}= \pm \mathbf{1 0 \%} \\
\mathrm{A}=125 \mathrm{~V}_{\mathrm{dc}} & \mathrm{~B}= \pm 5 \% \\
\mathrm{~B}=250 \mathrm{~V}_{\mathrm{dc}} & \mathrm{C}= \pm 2 \% \\
\mathrm{C}=500 \mathrm{~V}_{\mathrm{dc}} & \mathrm{D}= \pm 1 \%
\end{array}
$$

Example: The type number of a $6200 \mathrm{pF} / 125 \mathrm{~V}$ capacitor, tolerance $5 \%$, is C295AA/B6K2.

## C299 series - POLYSTYRENE CAPACITORS

## BOX TYPE

These box-type capacitors are extremely suitable as capacitance standard in measuring equipment and for RC network.
Inside the box the pack is absolutely proof against atmospheric influences, so that the excellent properties are maintained under the most adverse climatic conditions.

```

| 3.3 | 3 M 3 | 120 |  |  |

Intermediate capacitance values with a tolerance of $1 \%$ are available on request

The capacitors can be used in any position.
If desired, use can be made of mounting brackets as

illustrated in the figure; two if A is smaller than 60 mm , and four if $A$ is 60 mm cr larger.
The type number of the mounting brackets is $88480 / 00$. A wire of max. $2.5 \mathrm{sq} . \mathrm{mm}$ can be connected to each soldering tag.

## C304 series - CERAMIC CAPACITORS

## CLASS IB, TUBULAR TYPE, FOR $500 \mathrm{~V}_{\mathrm{dc}}$

## Application

Owing to the use of low-K ceramic material, these capacitors have low losses, a high stability and display a linear temperature dependence of the capacitance. These features render the capacitors ideally suited for application in high frequency equipment, especially in resonant circuits in which advantage can be taken of the linear temperature coefficient to compensate the temperature dependence of the other components.
These capacitors have connecting leads of $0.6 \mathrm{~mm} \varnothing$ with a pitch of a multiple of one tenth of an inch, so that they are suitable for printed wiring circuits.

## Construction

The capacitors consist of a ceramic tube, partly metallised on the outside, and - except for the smallest capacitances - internally metallised. A coating of special grey lacquer protects the capacitors against atmospheric influences. The temperature coefficient, the capacitance and the tolerances are indicated by means of a colour code (see page C113). The inner electrode is connected to the lead at the side of the first colour strip (that of the temperature coefficient).

## Electrical specification

Unless otherwise specified, all electrical values apply to a temperature of $20+5^{\circ} \mathrm{C}$, an atmospheric pressure of $930-1060$ mbar and a relative humidity of $45 \%$ to $75 \%$.

## CERAMIC CAPACITORS - C304 series

CLASS IB, TUBULAR TYPE, FOR $500 \mathrm{~V}_{\mathrm{dc}}$

## Capacitance and tolerance

The table on next page gives the E12 capacitance series with a tolerance of $0.25 \mathrm{pF}, 0.5 \mathrm{pF}$ and $5 \%$, depending on the capacitance value. On request values appertaining to the E24 series can be supplied, provided acceptable quantities are ordered. This also applies to capacitors with tolerances of $20 \%$ of the E6 series, of $10 \%$ of the E12 series and with $2 \%$ and $1 \%$ tolerances for higher capacitance values. Further technical data upon request.

Temperature coefficients

## CERAMIC CAPACITORS - C306 series

## CLASS IB, HIGH VOLTAGE DISC TYPE

## Application

Owing to the use of low-K ceramic material, these series of disc capacitors have low losses, a high stability and display a linear temperature dependence of the capacitance. These features render the capacitors ideally suited for application in high frequency equipment, especially in resonant circuits in which advantage can be taken of the linear temperature coefficient to compensate the temperature dependence of other components.

## Construction

The capacitor consists of a ceramic disc, provided with a silver plating at both sides to which the connecting leads are soldered. In order to avoid lacquer on the leads the capacitor is only partly lacquered, after which the whole is covered with a solderable film which protects the unlacquered part against atmospheric influences.

## Electrical specification

Unless otherwise specified, all electrical values apply to a temperature of $20 \pm 5^{\circ} \mathrm{C}$, an atmospheric pressure of $930-1060$ mbar and a relative humidity of $45 \%$ to $75 \%$.

Fig. 1

Fig. 2

## Application

These midget-type ceramic capacitors are characterised by their low HF losses, high stability and a very low inductance. Therefore they are widely used in RF tuned circuits. The capacitors have been specially designed for use in small filters such as miniaturized IF transformers, bandpass filters, for radio and television receivers, discriminators, noise limiters, etc.

## Construction

The capacitors consist of a tiny ceramic tube, covered internally and externally with a fired-on silver electrode, each electrode being provided with a tinned copper connecting lead. The insulated version is covered with a coating of tan-coloured lacquer which permits these capacitors to be mounted close together or against a metal plate.
The capacitors are colour-coded according to IEC (see page C113), with the exception of those with the values of $3.9-8.2 \mathrm{pF}$ and 39 pF for the non-insulated version, which are marked in black script. The connecting leads can withstand a strain of at least 450 grammes.

## Electrical Specification

Unless otherwise specified, all electrical values apply to a temperature of $20 \pm 5^{\circ} \mathrm{C}$, an atmospheric pressure of $930-1060$ mbar and a relative humidity of $45 \%$ to $75 \%$.

## C333 series - CERAMIC CAPACITORS

## TYPE IB, PLATE CAPACITORS FOR $40 \mathrm{~V}_{\mathrm{dc}}$

## Application

These plate capacitors are especially designed for use in all kinds of small transistorised equipment, for tuning and other purposes where low losses are required.
Owing to the use of low K-ceramic material, these capacitors have low losses, a high stability and a linear temperature dependence of the capacitance. Their extremely small dimensions and pitch distance with a close tolerance, adapted to the standard pattern of printed wiring boards, makes them most suitable for those applications where miniaturisation and easy mounting are required.

## Construction

The capacitor consists of a thin rectangular ceramic plate, both sides of which are metallised. The capacitor is fully insulated by a special coating, which ensures an excellent behaviour under unfavourable atmospheric conditions. The temperature coefficient of the capacitors is indicated by a colour code which covers the capacitor fully or partly. The capacitor has a width of 5 mm maximum.

## Electrical specification

Unless otherwise specified, all electrical values apply to a temperature of $20 \pm 5^{\circ} \mathrm{C}$, an atmospheric pressure of $930-1060 \mathrm{mbar}$ and a relative humidity of $75 \%$.

## Mounting

When the leads have to be bent, cut or flattened, they should be relieved of the applied load at the body of the capacitor. For dip-soldering on printed wiring boards, a temperature up to $250^{\circ} \mathrm{C}$ and a soldering time of up to 5 seconds is permissible.

## C301, C318 series - CERAMIC CAPACITORS

## CLASS II, TUBULAR TYPE

C301, C318 versions

## Application

Class II tubular ceramic capacitors are made of high-K dielectric materials. They are suitable for bypass and coupling purposes in all kinds of equipment where a high capacitance and small dimensions are of importance and the losses need not be minimized. These capacitors can be supplied in the C301 and in the C318 range. If small dimensions are essential, preference is given to the former range, but if a linear temperature dependence is of greater importance, the latter range is recommended. The temperature dependence of the ranges C301 and C318 is illustrated by the graphs 1 and 2 respectively, the latter of which conforms to the class II-A requirements.

## Construction

The capacitors of both ranges consist of a ceramic tube, internally and partly externally covered with a fired-on coating of silver. Two leads of tinned copper, wound around the tube, are soldered to these coatings. A coating of special lacquer protects the non-insulated types against atmospheric influences. The coating of the insulated types allows them to be mounted close together or against a metal frame.

## Electrical specification

Unless otherwise specified, all electrical values apply at a temperature of $20 \pm 5^{\circ} \mathrm{C}$, an atmospheric pressure of $930-1060$ mbar and a relative humidity of $45 \%$ to $75 \%$.

## CERAMIC CAPACITORS - C301, C318 series

## CLASS II, TUBULAR TYPE

## Capacitance and tolerance

The table gives the E-6 capacitance series.
Capacitance values out of the E12 series are available on special order subject to minimum order release requirements. The C318 series is available upon request only, with a $10 \%$ tolerance on the capacitance and in acceptable quantities.

## C322, C325 series - CERAMIC CAPACITORS

## CLASS II, PIN-UP TYPE FOR 500 V $_{\mathrm{dc}}$ AND 125 V $_{\mathrm{dc}}$

## Application

These ceramic capacitors are suitable for bypass, coupling and general purposes, where low losses and high stability of capacitance are not of major importance. They feature a high insulation resistance and a low inductance. The configuration of the terminals is adapted to the printed wiring technique; when mounted in a vertical position, the capacitors occupy but a minor area.
The C325 series of pin-up capacitors have been designed for application where high voltages are not required, e.g. transistor equipment.

## Construction

The capacitor consists of an internally and externally fully metallised ceramic tube. The connecting leads of tinned copper, soldered to the metal layers, have a pitch of 7.5 mm .
The capacitors are coated with a tan-coloured insulation lacquer, which acts as a seal against moisture and mechanical damage, and permits the capacitors to be mounted close together, or against a metal plate. The capacitors are colour coded.

## Electrical specification

Unless otherwise specified all electrical values apply at a temperature of $20 \pm 5^{\circ} \mathrm{C}$, an atmospheric pressure of $930-1060$ mbar and a relative humidity of $45 \%$ up to $75 \%$.

Capacitance values according to E12 series are available on special order subject to minimum order release requirements.

## C331, C332 series - CERAMIC CAPACITORS

## TYPE II, PLATE CAPACITORS FOR $40 \mathbf{V}_{\mathrm{de}}$

## Application

These "microplates" are especially designed for use in all kinds of small transistorised equipment, for coupling and decoupling purposes. Their extremely small dimensions and pitch distance (with a close tolerance) adapted to the standard pattern of printed wiring boards, render them very suitable for those applications where miniaturisation and easy mounting are required. The capacitance of the C332 range depends little on temperature (graph 1). The C331 range has higher capacitance values at the same dimensions, but its temperature dependence is somewhat greater (graph 2).

## Construction

The capacitor consists of a thin rectangular ceramic plate of high-K material, both sides of which are metallised. The capacitor is fully insulated by a special coating, which ensures an excellent behaviour under infavourable atmospheric conditions. The capacitor width is 5 mm maximum.
The capacitors are marked in black script.

## Electrical specification

Unless otherwise specified, all electrical values apply at a temperature of $20 \pm 5^{\circ} \mathrm{C}$, an atmospheric pressure of 930-1060 mbar and a relative humidity of $75 \%$.

& \text { Capacitance values and tolerances . . . . . . . . . . . . . see tables }
\end{aligned}
$$

## Mounting

When the leads have to be bent, cut or flattened, they should be relieved of the applied load at the body of the capacitor. For dip-soldering on printed wiring boards, a temperature up to $250^{\circ} \mathrm{C}$ and a soldering time of up to 5 seconds is permissible.

graph 1

graph 2

## C330 series - CERAMIC CAPACITORS

## BARRIER LAYER CAPACITORS FOR 6V ${ }_{\text {de }}$

fig. 1

fig. 2

## Application

Owing to the use of a new technique of manufacturing, these capacitors have a very high capacitance and a low working voltage at very small dimensions.
Therefore they are very suited for coupling and decoupling purposes in small transistorised equipment, for example in IF stages of radio receivers.

## Construction

The capacitor consists of a thin rectangular plate, which has been given semiconducting properties by a reducing process. The surface is oxidised on both sides, thus forming a barrier layer. Thus two capacitances with a series resistance in between are formed (see Fig. 1).
The whole is covered with a blue insulating lacquer. The distance between the leads is fixed at 2.5 mm , with a close tolerance, adapted to the standard pattern of printed-wiring boards. The 22000 and 47000 pF capacitors are marked in black script as shown in Figs 1 and 2 respectively. The 100000 pF type is marked with: $0.1 ; 6 \mathrm{~V}$.

## Electrical specification

Unless otherwise specified, all electrical values apply to a temperature of $20 \pm 5^{\circ} \mathrm{C}$, an atmospheric pressure of $930-1060$ mbar and a relative humidity of $45 \%$ to $75 \%$.

## Composition of the type number

## C321 series - CERAMIC CAPACITORS

## SAFETY CAPACITORS, TUBULAR TYPE FOR $\mathbf{7 0 0 V}_{\text {de }}$

## Application

These ceramic capacitors withstand a test voltage of $2000 \mathrm{~V}_{\mathrm{rms}}$ for 1 minute, the international requirement for capacitors connected between the mains and conductive parts which might be touched. Therefore, they are very suitable for use in radio and television sets.

## Construction

The capacitor consists of a ceramic tube internally and partly externally covered with a fired-on coating of silver. The connecting leads are soldered to the silver electrodes. A coating of special grey lacquer protects the capacitors against atmospheric influences. The capacitors are marked in black script with an H followed by capacitance value in pF and a letter indicating the tolerance.

## Electrical specification

Unless otherwise specified, all electrical values apply at a temperature of $20 \pm 5^{\circ} \mathrm{C}$, an atmospheric pressure of 930-1060 mbar and a relative humidity of $45 \%$ to $75 \%$.

C90

## C309 series - CERAMIC CAPACITORS

## CLASS I, CLASS II; MINIATURE FEED-THROUGH CAPACITOR FOR 350V

## Application

Ceramic feed-through capacitors are designed for decoupling the supply leads of high-frequency equipment, for instance in T.V. tuners. However, due to their extremely low inductances, they might also be used in frequency-determining circuits in similar equipment. Since in this application (e.g. in VHF/UHF tuners) low losses are required, class I types should be chosen. The version with a central pin is provided with sufficient soldering tin to facilitate mounting.

Fig. 1.

## Construction

The capacitors consist of a ceramic tube provided with silver electrodes. The outer connection is formed by a flange, and the inner one by a split pen (Fig. 1) or an axial lead (Fig. 2). The split-pen version is provided with sufficient soldering tin, which facilitates mounting. The capacitors are marked in black script or with a colour dot. The lead feed-through type is not marked.

*12 mm for the 4700 pF capacitor

## Electrical specification

Unless otherwise specified all electrical values apply at a temperature of $20 \pm 5^{\circ} \mathrm{C}$, an atmospheric pressure of $930-1060$ mbar and a relative humidity of $45 \%$ to $75 \%$

## CERAMIC CAPACITORS - C309 series

## CLASS I, CLASS II; MINIATURE FEED-THROUGH CAPACITORS FOR $350 \mathbf{V}_{\mathrm{de}}$

## Mounting

The following soldering procedure is advised:
Heat and cool gradually (approximately $50^{\circ} \mathrm{C} / \mathrm{s}$ ). The time during which the soldering tin is fluid should be kept as short as possible. The central lead should not be soldered within 1 mm from the tube. A soldering alloy of $60 \% \operatorname{tin}, 36 \%$ lead and $4 \%$ silver, or $50 \% \operatorname{tin}, 46 \%$ lead and $4 \%$ silver is recommended.

## CERAMIC CAPACITORS - B8 600 01/02

TUBULAR TRIPLE BY-PASS TYPE

This multiple tropic-proof component meets the demand of the TV industry as regards simplification of receiving sets with tubes. Its compactness and efficient shape permit it to be mounted in the centre screen of tube sockets.
The component is also very suitable to be used in combination with printed wiring.

## SYNTHETIC FOIL TUNING CAPACITORS

## SURVEY

The capacitors included in this range have a dielectric consisting of laminated synthetic foil and air. In addition to being of relatively small size they are of a remarkably high quality and compare very favourably with similar components of other manufacture.
The capacitors are particularly suitable for miniature personal radios and the larger portable variety, and may also be employed in all-wave receivers of the battery driven type.
The moving vanes rotate freely between the fixed stator vanes, ensuring good tracking at different frequencies. Clockwise rotation of the tuning shaft will produce an increase in capacitance.
In the interests of performance, adherence to the appropriate mounting plan given for each type is strongly recommended.
To avoid undue stress within the capacitor base plate when mounting, it is advisable to use screws having cylindrical heads rather than those of the counter-sunk type.

## SYNTHETIC FOIL TUNING CAPACITORS

## TYPE AC1039

For toy radio sets and similar simple TRF receivers.

## CERAMIC TRIMMERS - C004 series

SURVEY
The trimmers are designed for use in radio and television receivers as well as industrial equipment. All types, except the C004FA, consist of an internally ground ceramic tube, in which an invar rotor is guided by a phosphor-bronze wire spring. Both ends of the rotor (one end only of C004EB) are slotted for screwdriver operation.
In certain applications the negative temperature coefficient characteristic of the components ensures adequate compensation for the effects of different temperatures.

## CERAMIC TRIMMERS - C004 series

C004JA,ZZ-MIDGET TUBULAR TYPE

The design of these trimmers is similar to the type C004AA, the several variations of which have proved reliable in countless TV tuners and radio sets. A thin, internally ground ceramic tube closely fits a threaded invar spindle. The spindle is guided by a U-shaped spring fixed by the silver plated brass cap. The JA type cap is to be soldered to the chassis thus providing excellent contact and also a sturdy mechanical mount. ZZ-types are secured by a mounting nut.
The stator is a silver-plated sleeve, fitted over the ceramic tube, which possesses a soldering eyelet.

## C004 series - CERAMIC TRIMMERS

## TUBULAR TYPE C004EA, EB

These capacitors have been designed for the precision trimming of professional equipment which operate at the higher frequencies. Their simple form of construction guarantees high reliability and facilitates, moreover, a high breakdown voltage, good stability and high adjustment accuracy.
For many applications the negative temperature coefficient characteristic results in adequate compensation at various temperatures. The small dimensions contribute to the miniaturization of electronic equipment.

Wire-wound trimmers have, over many years, proved to be very suitable for the trimming of radio sets and for use as adjustable capacitors in filters (e.g. as a padding capacitor).
Because of the high adjustable capacitance values available, they sometimes can replace the expensive combination of fixed capacitor and rotary trimmer.
The considerable advantages in price and volume serve to outweigh the one drawback of wire trimmers, namely, that their capacitance value can be decreased but not in-
 creased.

Stator . . . . . . . . .
Mounting . . . . . . .
Climatic conditions . . .
$\begin{aligned} & \text { Available on request types } \\ & \text { with }\end{aligned}$
nickel-plated brass with pressed-in siliconized ceramic stator supports. brass vanes soldered on a shaft, which has a double-track ball-bearing and is slotted for screwdriver operation ( 0.8 mm width, 1.2 mm depth). Friction springs ensure a stable setting; insulated or non-insulated rotor optional. The $6 \mathrm{~mm} \varnothing$ shaft can also be fitted with a control knob.
brass vanes soldered to brass studs which are fixed to the ceramic stator support of the base.
in a 10.5 mm hole in a 4 mm max. thick panel by means of a nut, supplied with each capacitor.
tropic and arctic proof.
a. different operating voltages;
b. variations of capacitance;
c. different shaft lengths.

## General survey - CARBON RESISTORS

At the left, insulated carbon resistors; at the right high-stability types. From top to bottom $0,125 \mathrm{~W}, 0,25 \mathrm{~W}, 0,5 \mathrm{~W}$, and 1 W types.

Resistors of the cracked-carbon film construction have superior figures for stability of resistance, noise level and temperature coefficient as compared with resistors of carbon-composition construction.

Two classes of carbon resistors are available:

1. insulated types, resistance tolerance $5 \%, 10 \%$ power rating at $70^{\circ} \mathrm{C}: 0,1 \mathrm{~W}, 0,125 \mathrm{~W}, 0,25 \mathrm{~W}, 0,5 \mathrm{~W}, 1 \mathrm{~W}, 2 \mathrm{~W}$
2. high stability types, resistance tolerance $1 \%$ power rating at $70^{\circ} \mathrm{C}: 0,125 \mathrm{~W}, 0,25 \mathrm{~W}, 0,5 \mathrm{~W}, 1 \mathrm{~W}$

Insulation resistance: this is measured at $500 \pm 50 \mathrm{~V}_{\mathrm{dc}}$ for $1 \mathrm{~min} \pm 5 \mathrm{sec}$, in accordance with section 2.4.2. of the IEC Publication No. 109.

Stability test: a direct voltage is applied in cycles of 90 min . on and 30 min . off, at an ambient temperature of $70 \pm 2^{\circ} \mathrm{C}$, throughout an endurance test of 42 days. The voltage applied is the maximum permissible voltage.
Damp-heat test (long-term exposure): the resistors are subjected to the test-C procedure of the IEC Publication No. 68. Insulated types for 21 days, high-stability types for 56 days.
Guarantees: $\Delta \mathrm{R}=1 \%$ for $\mathrm{R}_{\text {nom }}=\max .100 \mathrm{k} \Omega ; \Delta \mathrm{R}=2 \%$ for $\mathrm{R}_{\text {nom }}=$ between $100 \mathrm{k} \Omega$ and । $\mathrm{M} \Omega ; \Delta \mathrm{R}=3 \%$ for $\mathrm{R}_{\mathrm{nom}}=$ beyond $1 \mathrm{M} \Omega$.

## E011 series - CARBON RESISTORS

INSULATED PIN-HEAD TYPES 0.05 W

Noise: $<10 \mu \mathrm{~V} / \mathrm{V}$
This resistor is as small as a pin's head; it consists of a pellet of carbon composition which ensures a high reliability; its stability, however, is less favourable than that of our cracked-carbon standard resistors; main application in miniature apparatus, such as hearing aids, small-distance calling sets, weather radio-probes, etc.

| resistance range ${ }^{1}$ | maximum <br> dissipation <br> at $70^{\circ} \mathrm{C}^{2}(\mathrm{~W})$ | max. continuous <br> operating voltage <br> (d.c. or a.c.) $(\mathrm{V})$ | tolerance <br> $\%$ | type number |

## 8351 series - WIRE-WOUND RESISTORS

PRECISION TYPES - 0.4W, $0.6 \mathrm{~W}, 0.7 \mathrm{~W}, 1.2 \mathrm{~W}, 1.8 \mathrm{~W}$

These small low-power resistors are eminently suitable for applications requiring dependable, accurate and highly stable resistances, as e.g. in telecommunication installations, measuring apparatus and other professional equipment. They are particularly suited for use in low-frequency filters. Owing to their lightness, the resistors can be mounted in the wiring of the apparatus. The resistors are tropic proof, and are coated by a red lacquer.

## Stability.

After 1000 hours of continuous loading at $W_{\text {max }}$ at an ambient temperature of $40^{\circ} \mathrm{C}$, the resistance variation is max. $\pm 0.25 \%$, even under adverse climatic conditions.
Minimum permissible temperature $-55^{\circ} \mathrm{C}$

Derating curve (power rating as a function of ambient temperature)

## Composition of the type number

## WIRE-WOUND RESISTORS - $\mathbf{8 3 5 4}$ series

BROWN ENAMELLED TYPES - 5.5W, 8W, 10W, 16W

These light-weight, brown enamelled, wire-wound resistors have been designed with the main object of obtaining maximum reliability and great mechanical strength. As a consequence of their small dimensions, these resistors can be mounted in the wiring of the apparatus. The resistors are tropic proof.

${ }^{1}$ Tolerance $\pm 5 \%$ : E24 series; ${ }^{2}$ tolerance $\pm 10 \%$ : E12 series; ambient temperature

Permissible load
For resistors mounted horizontally in a free space without draught and with a temperature of $40^{\circ} \mathrm{C}$, the temperature rise is max. $330^{\circ} \mathrm{C}$ when being loaded at $W_{\max }$.

Permissible temporary overloads:
$2 W_{\text {max }}$ for 15 minutes;
$10 \mathrm{~W}_{\max }$ for 10 seconds.
Minimum permissible temperature: $-55^{\circ} \mathrm{C}$
Temperature coefficient: -50 to $+140 \times 10^{-6} \Omega$ per ohm and per ${ }^{\circ} \mathrm{C}$. This amounts to a change of the resistance between -0.5 and $+1.4 \%$ per $100^{\circ} \mathrm{C}$ temperature rise

Derating curve: see figure.
The resistors can be mounted with the aid of mounting brackets or be connected to the wiring.

## E112 series - WIRE-WOUND RESISTORS

## GREEN CEMENTED TYPE 5W - 8W

Because of their small dimensions these load resistors are very suitable to be included in the wiring of electric and electronic apparatus, e.g. in T.V. sets.
The cement protection is non-inflammable.

For derating curve and $\triangle$ t-curve see next page.

## Survey of adjustable and non-adjustable types

These green enamelled wire-wound resistors have been designed to obtain maximum reliability and great mechanical strength. They are made of top-grade materials and are subjected to severe tests. The resistors are tropic-proof; they are available in adjustable and non-adjustable versions, both with soldering taps or with screws on the side terminals. Climatic group number 55/155/56 according to IEC68.

> Permissible voltage between resistor and metal mounting plate Adjustable (with movable connecting strap) $10 \mathrm{~W}-40 \mathrm{~W} . .$.

Max. dissipation (see following pages)
Permissible temporary overloads: $2 \mathrm{~W}_{\max }$ for 15 minutes, $10 \mathrm{~W}_{\max }$ for 5 seconds.
Minimum permissible temperature: $-55^{\circ} \mathrm{C}$ (maximum dissipation at $40^{\circ} \mathrm{C}$ ambient temperature) For resistors mounted horizontally in a free space without draught and with a temperature of $40^{\circ} \mathrm{C}$, the temperature rise is max. $330^{\circ} \mathrm{C}$ when being loaded at $\mathrm{W}_{\text {max }}$. For higher ambient temperature, see figure.

Temperature coefficient -50 to +140 $\times 10^{-6} \Omega$ per ohm and per ${ }^{\circ} \mathrm{C}$. This amounts to a change of the resistance between $-0.5 \%$ and $+1.4 \%$ per 2 $100^{\circ} \mathrm{C}$ temperature rise.

## Mounting.

The resistors should preferably be mounted by means of a rod passed through the tube. Suspension to the terminals is permissible for 8 W types only.

Derating curve: see figure
(see also page E14)

## WIRE-WOUND RESISTORS - E 108AA series

## B8 300 series - WIRE-WOUND RESISTORS

## ADJUSTABLE TYPES

Maximum dissipation is only permissible if the full length of the resistance wire is used. If only part of it is used, the permissible load is a proportionate part of $W_{\text {max }}$. For example, an adjustable resistor of $120 \Omega, 100 \mathrm{~W}$, of which only $90 \Omega$ is used, may be loaded up to $90 / 120 \times 100=75 \mathrm{~W}$.

10W, 16W. 25W, 40W -enamelled

The resistors are provided with soldering tags and an adjustable connecting strap.

## B8 301 series - WIRE-WOUND RESISTORS

CEMENTED SECTION TYPES, MADE TO CUSTOMERS SPECIFICATION 24-52 W

These space-saving load resistors consist of a resistor body on which two or more (maximum nine) wire resistor elements can be wound, either separately or interconnected. They can be used to advantage in electric and electronic apparatus in which more than one load resistor is applied, e.g. in TV sets. The resistors must be loaded with at least $60 \%$ of the nominal load to protect them against humidity influences.
Features: low price, simple mounting, space saving, high permissible loading, non-inflammable.

Resistance values: minimum $3 \Omega$, maximum see table. Resistance tolerance $\pm 10 \%$.
Temperature coefficient -50 to $+160.10^{-6} / \mathrm{C}$

$\mathrm{K}=$ normally $4^{+0.5} \mathrm{~mm}$
$\mathrm{L}=$ minimum $\quad 63 \mathrm{~mm}$ maximum 140 mm

| maximum total resistance value ${ }^{1}$ (k $\Omega$ ) | maximum permissible total load $P_{\text {max }}{ }^{4}$ |  | standard tube length (mm) | maximum number of sections |

| 48 | 44 | 52 | 140 | 9 |

${ }^{1}$ Maximum values to be obtained with standard tube lengths
${ }^{2} \mathrm{P}_{\text {max }}$ is the maximum permissible total load with the resistor mounted horizontally by means of mounting supports and at an ambient temperature of $40^{\circ} \mathrm{C}$; ${ }^{3}$ preferred version

- Max. permissible overload: during 15 minutes $2 \times \mathrm{P}_{\text {nom }}$, during 10 seconds $10 \times \mathrm{P}_{\text {nom }}\left(\mathrm{P}_{\text {nom }}\right.$ is the maximum permissible load of a section at an ambient temperature of $40^{\circ} \mathrm{C}$ ).

Temperature rise $\mathrm{IT}=\mathrm{f}(\mathrm{P})$.

## WIRE-WOUND RESISTORS - B8 301 series

## CEMENTED SECTION TYPES, MADE TO CUSTOMERS SPECIFICATION

Two or more resistor elements are wound in one layer on a ceramic tube version R or P (see figure). The ends of the windings are provided with connecting tags. When the windings are interconnected a common tag is used between the two resistors concerned, functioning as a tapping. The windings are coated with a layer of green cement; the connecting tags are tinned.

The resistors can be mounted by means of a bolt or a tapped rod passed through the ceramic tube, or by means of mounting supports. Mounting supports for resistors of the R-version are available under type number B1 45513; supports for resistors of the P-version are not available.

## Composition of the type number

When ordering, please state:

1. basic type number B8301
2. number of sections
3. resistance of each section
4. load $\mathrm{P}_{\text {nom }}$ of each section

5. interconnections, if required
6. version $R$ or $P$

The resistor will be designed according to these data and with a minimum standard length (unless. otherwise specified).

## E086 series - CARBON TRIMMING POTENTIOMETERS

## MINIATURE TRIMMER

This miniature version of the E097 series will find its application mainly in transistorized equipment.
It is intended for pre-set resistance control with provision for re-adjustments, and has a high degree of reliability in spite of its small dimensions. Only one version is available, namely that for mounting on printedwiring boards.
The resistance values are between $100 \Omega$ and $1 \mathrm{M} \Omega$, the maximum permissible load at $40^{\circ} \mathrm{C}$ ambient temperature is $0.1 \mathrm{~W}(0.25 \mathrm{~W}$ for the E097 series).
The annular carbon track is riveted on a base plate of resin-bonded paper. The stop is formed by the terminal for the runner. Adjustment is done by means of a small screwdriver or trimming tool. The angle of rotation is $240^{\circ} \pm 5^{\circ}$. The terminals will fit a printed-wiring board with a pitch of 2.54 mm .

Resistance tolerance . . . . . . . . . . . . . . . . . . . $\pm 20 \%$

| $1 \mathrm{M} \Omega$ | 20000 | 70 | 0.22 | /1M |

$R_{m i n}$ is the remaining resistance at either end just before the slider shorts to the respective terminal. $\mathrm{V}_{\max }$ is the max. voltage (d.c. or r.m.s.) permissable between the ends of the resistance element at $\mathrm{T}_{\mathrm{amb}}=40^{\circ} \mathrm{C}$.
is max is the maximum permissible current through the slider contact.

## E097 series - CARBON TRIMMING POTENTIOMETERS

## STANDARD TRIMMER, SCREWDRIVER-OPERATED

These stable and reliable carbon trimming potentiometers of simple construction are particularly suitable for use in radio and television receivers, for preset resistance control, with facilities for casual adjustments.

The following versions are available:

1. type A - for direct mounting in the wiring;
2. type C - for vertical mounting, 3-pins (printed-wiring);
3. type $D$ - for horizontal mounting, 3-pins (printed-wiring);
4. type E - for horizontal mounting, 3 tags (on enlarged base);

Permissible load
Maximum 0.25 W at an ambient temperature of $25^{\circ} \mathrm{C}$, and maximum 0.15 W at $70^{\circ} \mathrm{C}$.
The voltages $\mathrm{E}_{\text {max }}$ corresponding with these loads at any actual resistance value can be found by means of the figure.

Permissible temperature
The ambient temperature may lie between -10 and $+70^{\circ} \mathrm{C}$.

Tolerance $\pm 20 \%$

E088 series - SINGLE CARBON POTENTIOMETERS (16 mm)

## WITH OR WITHOUT SWITCH

The application of these potentiometers is volume and tone control in small-size battery-powered sets. Types are available for conventional panel mounting, and also for use on p.w. boards (with or without fixing nut). The potentiometers can be supplied with a reliable, single-pole rotary switch, which makes them particularly suitable for use in transistorised equipment.

## WITHOUT SWITCH

These single carbon potentiometers ( 23 mm outer diameter) are particularly suitable for use in military and industrial equipment. The type fulfils MIL-R 94-A and CCTU-05-01 requirements. On request resistance values according to MIL-R-94-A can also be supplied.

Permissible load
linear potentiometer: $1 / 4 \mathrm{~W}$
logarithmic potentiometer: $1 / 8 \mathrm{~W}$.

## SINGLE CARBON POTENTIOMETERS ( 23 mm ) - E098 series

## WITH OR WITHOUT SWITCH

These potentiometers, developed for panel mounting, are supplied with linear or logarithmic grading, fixing nut, with or without switch. Preferred spindle length: 60 mm , diameter $1 / 4$ inch or 6 mm .

Permissible load: for linear grading
0.25 W at $25^{\circ} \mathrm{C}$ 0.125 W at $70^{\circ} \mathrm{C}$ for logarithmic grading 0.125 W at $25^{\circ} \mathrm{C}$ 0.063 W at $70^{\circ} \mathrm{C}$

Carbon potentiometers with a diameter of 23 mm are available for the nominal resistance values $R_{\text {nom }}$ listed in the table.
The tolerance on $\mathrm{R}_{\text {nom }}$ is $\pm 20 \%$.

The potentiometers have been tested at $1000 \mathrm{~V}(50 \mathrm{c} / \mathrm{s})$ between terminals and meta! cover; the switches have been tested at $2000 \mathrm{~V}(50 \mathrm{c} / \mathrm{s})$.

The ambient temperature may lie between -10 and $+70^{\circ} \mathrm{C}$. The potentiometers are tropic proof.

Characteristic curves of resistance between slider and left terminal ( $\mathrm{R}_{\mathrm{s}} / \mathrm{R}_{\text {tot }}$ in \%) relative to angle of clockwise rotation.
Customer's values and curves can be made to order under certain conditions.

## E091 series - TANDEM CARBON POTENTIOMETERS ( 23 mm )

## WITH OR WITHOUT SWITCH

Tandem potentiometers are suitable for stereophonic recording and reproduction; the potentiometers ensure adequate equality of the two signals, both in volume and tone, within the range of from $1 \mathrm{k} \Omega$ to $2.2 \mathrm{M} \Omega$. Tandem potentiometers are composed of two single potentiometers which are ganged; their resistance values and gradings are as identical as possible.

Disparity of potentiometers with identical nominal values of $R_{1}$ and $R_{2}$ :
a. $\left|R_{1}-R_{2}\right|<25 \% R_{\text {nom }}$.
b. attenuation matching of ganged potentiometers:

the error is defined in $d B=20\left|\log \frac{E}{U_{1}}-\log \frac{E}{U_{2}}\right|$
for linear types:
from $10 \%-50 \%$ of $R_{\text {tot }}<2 \mathrm{~dB}$
from $90 \%-50 \%$ of $R_{\text {tot }}<2 \mathrm{~dB}$
for logarithmic types: see table

| attenuation |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| logarithmic | tap at $10 \% R_{\text {tot }}$ | tap at $20 \% R_{\text {tot }}$ | tap at $40 \% R_{\text {tot }}$ | error |
| $0-20 \mathrm{~dB}$ | $0-20 \mathrm{~dB}$ | $0-20 \mathrm{~dB}$ | $0-20 \mathrm{~dB}$ | $<2 \mathrm{~dB}$ |
| $20-30 \mathrm{~dB}$ | $20-30 \mathrm{~dB}$ | $20-30 \mathrm{~dB}$ | $20-28 \mathrm{~dB}$ | $<3 \mathrm{~dB}$ |
| $30-40 \mathrm{~dB}$ | $30-34 \mathrm{~dB}$ | $30-34 \mathrm{~dB}$ |  | $<4 \mathrm{~dB}$ |

Tandem potentiometers with identical values of $R_{1}$ and $R_{2}$ satisfy stereo requirements, except when $R<1 \mathrm{k} \Omega$.

Mounting holes

## WITH OR WITHOUT SWITCH

These twin potentiometers are composed of two individual types of the E098 series with coaxial spindles and meet the demand for controls with duplex knob operation.

## Composition of the type number E 090C.

G without switch

| AC/A36A | 10.5 | 4.8 | 20 |
| AE/A36A | 10.5 | 4.8 | 20 |

Loading at $W_{\text {max }}$ is only permissible if the full length of the resistance wire or ribbon is used. If only part of it is used, the permissible load is a proportional part of $W_{\text {max }}$.

Our range of NTC thermistors consists of the following types:

1. standard disc types series $B$;
2. standard disc types series $E$;
3. standard rod types;
4. mounted disc types;
5. miniature types;
6. indirectly heated types;
7. special types for motor cars and household appliances;
8. special types for radio and television.

## STANDARD DISC TYPES SERIES B

In the course of 1966 the lead diameter will be increased to 0.6 mm .

## MOUNTED DISC TYPES

For simple mounting with nut and bolt, discs of the standard serias B are available soldered on a metal strip.

| $R_{25}$ | type number |
| :---: | :---: |
| $(\Omega)$ |  |
| $4 \pm 20 \%$ | E201ZZ/27 |
| $8 \pm 20 \%$ | $/ 30$ |
| $50 \pm 20 \%$ | $/ 31$ |
| $130 \pm 20 \%$ | $/ 11$ |
| $500 \pm 20 \%$ | $/ 32$ |
| $1300 \pm 20 \%$ | $/ 33$ |

The resistance/temperature characteristics are the same as those of the standard discs B (see page E42).

## PTC - POSITIVE-TEMPERATURE-COEFFICIENT THERMISTORS

The range of PTC thermistors consists of the following types:

1. standard discs $1 \mathrm{~W}, 40-50 \mathrm{~V}$;
2. standard discs $0.5 \mathrm{~W}, 25 \mathrm{~V}$;
3. special types.

STANDARD DISCS $1 \mathrm{~W}, 40-50 \mathrm{~V}$ SERIES

| $\begin{gathered} R_{25} \\ \pm 15 \%(\Omega) \end{gathered}$ | $R$ at other temp. |  | switch temp. ${ }^{1}$ <br> (approx.) <br> $\left({ }^{\circ} \mathrm{C}\right)$ | $\begin{aligned} & \hline \text { max. temp. } \\ & \text { coeff. } \\ & \left(\% /{ }^{\circ} \mathrm{C}\right) \end{aligned}$ | $V_{\max }{ }^{2}$ <br> (V) | colour code | type number |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 50 | $100^{\circ} \mathrm{C}$ | 3-20 k $\Omega$ | +35 | +7 | 40 | red | E 220 ZZ/01 |
| 30 | $\begin{array}{r} 40^{\circ} \mathrm{C} \\ 100^{\circ} \mathrm{C} \end{array}$ | $\begin{aligned} & <90 \Omega \\ & >10 \mathrm{k} O \end{aligned}$ | $+50$ | +15 | 50 | orange | 102 |
| 50 | $\begin{array}{r} 60^{\circ} \mathrm{C} \\ 100^{\circ} \mathrm{C} \end{array}$ | $\begin{array}{r} <100 \Omega \\ >1 \mathrm{k} \Omega \end{array}$ | $+80$ | $+30$ | 50 | yellow | 103 |
| 40 | $\begin{array}{r} 95^{\circ} \mathrm{C} \\ 130^{\circ} \mathrm{C} \end{array}$ | $\begin{aligned} & <80 \Omega \\ & >10 \mathrm{k} \Omega \end{aligned}$ | +110 | $+60$ | 50 | green | 104 |

${ }^{1}$ Defined as the temperature at which the resistance value is twice the value at $25^{\circ} \mathrm{C}$.
${ }^{2}$ Breakdown voltage.
Dissipation constant for all types approx. $10 \mathrm{~mW} /{ }^{\circ} \mathrm{C}$.

## Important.

The above resistance values are measured at 1.5 V . Higher voltages may yield different values due to self-heating and voltage-dependency.

## PTC - POSITIVE-TEMPERATURE-COEFFICIENT THERMISTORS

## SPECIAL TYPES

Special types for high voltage applications up to hundreds of volts or low Curie temperatures (to $-40^{\circ} \mathrm{C}$ ) can be made on request. For use as a motor protection device types have been developed with a special insulation against high voltage.

A typical example is the E220ZZ/06 which is used as a current limiting device in telecommunication apparatus.

Resistance/temperature characteristic

Data E220ZZ/0s
$\mathrm{R}_{25}: 36-50 \Omega$
$\mathrm{V}_{\text {max }}: 180 \mathrm{~V}_{\mathrm{dc}}$
Current at $180 \mathrm{~V}:<10 \mathrm{~mA}$

Voltage/current characteristic

## VOLTAGE-DEPENDENT RESISTORS - VDR

The range of VDR resistors consists of the following types:

1. standard disc types with leads;
2. standard disc types with a hole;
3. standard rod types;
4. small disc types for special purposes;
5. special disc types for contact protection;
6. asymmetric types.

## STANDARD DISC TYPES WITH LEADS

Most types are lacquered, inpregnated and colour-coded. Only some of the most important types are mentioned in this survey. Special types can be made on request. Values preferable according to I.E.C.-E12 series.

Tolerances: normal tolerance on voltage $\pm 20 \%$; VDR's with a tolerance of $\pm 10 \%$ can also be supplied. For $\pm 10 \%$ tolerance change $P$ of type number into $A$.
The lacquered $\pm 10 \%$ types have an extra silver colour band.
E.g. E299DD/P...: $\pm 20 \%$ tolerance on voltage

E299DD/A...: $\pm 10 \%$ tolerance on voltage and extra silver colour band

## VOLTAGE-DEPENDENT RESISTORS - VDR

## STANDARD DISC TYPES WITH A HOLE

For mounting purposes VDR's with a hole can be supplied.
The electrical characteristics of these VDR's are identical to those of the equivalent lacquered types.
The discs are marked with the type number suffix.

| $\begin{gathered} 1 \\ (m A) \end{gathered}$ | $\begin{gathered} E \\ (V) \end{gathered}$ | $\beta$ | C | $\mathrm{W}_{\text {max }}$ <br> (W) | $\begin{aligned} & \text { dimensions } \\ & (\mathrm{mm}) \end{aligned}$ |  | type number |

Measured under pulse conditions

Voltage/current
characteristics

The characteristic of type E $298 \mathrm{ZZ} / 06$ can be compared with that of type E 298 ED/A269. The same holds for types E 298 ED/P353 and E 298 ED/A260.

## VDR - VOLTAGE-DEPENDENT RESISTORS

## SMALL DISC TYPES FOR SPECIAL PURPOSES

For use in e.g. small battery motors (to protect the collector and to suppress interferences in radio and TV) type E297ZZ/01 has been developed which can be mounted in the rotor.

Data E297ZZ/01:
current at $6 \mathrm{~V}_{\mathrm{dc}} \leq 1 \mathrm{~mA}$ current at $25 \mathrm{~V}_{\text {dc }} \geq 10 \mathrm{~mA}$ $W_{\text {max }} 0.1 \mathrm{~W}$

For use in colour television a special range of VDR discs has been developed:

Tentative data

| 1 | $E$ | tolerance | type number |
| :---: | :---: | :---: | ---: |
| $(\mathrm{mA})$ | $(V)$ | on voltage | E297 ZZ/02 |
| 1 | 6 | $\pm 20 \%$ | 103 |
| 1 | 9 | $\pm 20 \%$ | 104 |
| 1 | 12 | $\pm 15 \%$ | 105 |
| 1 | 15 | $\pm 15 \%$ | 106 |
| 1 | 18 | $\pm 12 \%$ |  |

## VOLTAGE-DEPENDENT RESISTORS - VDR

## SPECIAL DISC TYPES FOR CONTACT PROTECTION

## Colour code:

For all types:
colour band I is grey
colour band III is white
Colour band II indicates the last digit of the type number:
$0=$ black
1 = brown
$2=$ red
3 = orange
$4=$ yellow
$5=$ green
$6=$ blue

This range is specially developed for contact protection of relays in telephone exchanges. These VDR's are extremely stable and can stand current surges of decimals of Amps without changing their characteristics perceivably.
Two versions are available: the VAP-SF series without leads in a non-lacquered, fully impregnated version and the VAP-AF series with leads in a lacquered and also impregnated version.
These resistors meet the severe specifications of official inspection offices for telephone equipment.

| $\begin{gathered} V \\ (V) \end{gathered}$ | $\begin{gathered} 1 \\ (\mathrm{~mA}) \end{gathered}$ | $\begin{gathered} \left.V^{1}\right) \\ (\text { pulse) } \end{gathered}$ | $\begin{gathered} \left.{ }^{11}\right) \\ (m A) \end{gathered}$ | $\begin{aligned} & W_{\max } \\ & (\mathrm{W}) \end{aligned}$ | diameter (D) (mm) | type number |  |

[^44]
## VDR - VOLTAGE-DEPENDENT RESISTORS

## ASYMMETRIC TYPES

Based on a barrier-layer effect, the asymmetric voltage-dependent resistors differ in many aspects from the well-known voltage dependent resistors made of silicon carbide. Its characteristic is asymmetric; in the forward direction, the characteristic shows a very low $\beta$-value and C -value while in the reverse direction $\beta$ - and C -values are much higher. Its parallel capacitance in forward as well as in reverse direction is relatively high.
They can be used for instance for stabilisation of the supply current in transistorised battery receivers.

For the time being two types are available.

Tentative data

|  | at $T_{\mathrm{amb}}=25^{\circ} \mathrm{C}$ | type number |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | E295ZZ/01 | E295ZZ/02 ${ }^{1}$ |  |
| forward | ```voltage at 1 mA temp. coeff.``` | $\begin{aligned} & 1.0 \mathrm{~V} \pm 10 \% \\ & >-0.2 \% /{ }^{\circ} \mathrm{C} \\ & 0.05-0.08 \end{aligned}$ | $\begin{aligned} & 1.35 \mathrm{~V} \pm 10 \% \\ & >-0.2 \% /{ }^{\circ} \mathrm{C} \\ & 0.06-0.09 \end{aligned}$ |  |
|  | $\begin{array}{ll} \text { capacitance } \quad \text { at } 0 \mathrm{~mA} \\ & \text { at } 5 \mathrm{~mA} \\ \text { max. permissible current } \end{array}$ | $\begin{aligned} & \sim 0.15 \mu \mathrm{~F} \\ & \sim 10 \mu \mathrm{~F} \\ & 25 \mathrm{~mA} \end{aligned}$ | $\begin{aligned} & \sim 0.15 \mu \mathrm{~F} \\ & \sim 10 \mu \mathrm{~F} \\ & 20 \mathrm{~mA} \end{aligned}$ | In the course of 1966 the colour code will be changed as follows: |
| reverse direction | current at 5 V <br> capacitance at 0 V <br>  at 5 V <br> max. permissible voltage  | $\begin{aligned} & <20 \mu \mathrm{~A} \\ & \sim 0.15 \mu \mathrm{~F} \\ & \sim 0.05 \mu \mathrm{~F} \\ & 5 \mathrm{~V} \end{aligned}$ | $\begin{aligned} & <20 \mu \mathrm{~A} \\ & \sim 0.15 \mu \mathrm{~F} \\ & \sim 0.05 \mu \mathrm{~F} \\ & 5 \mathrm{~V} \end{aligned}$ | E295ZZ/01: black and brown band <br> E295ZZ/02: black and red band |

[^45]temperature range: -30 to $+70^{\circ} \mathrm{C}$
cathode is indicated by a white colour dot

## VOLTAGE-DEPENDENT RESISTORS - VDR

ASYMMETRIC TYPES

Voltage/current characteristics of the E295 series

Conduction direction

Reverse direction

## LDR - LIGHT-DEPENDENT RESISTORS

## TYPE NUMBER B8 73103

Light-dependent resistors are virtually small photoconductive cells, encapsulated in glass and special synthetic resin, and provided with two tinned copper connecting leads ( $0.6 \varnothing \times 15 \mathrm{~mm}$ )

Resistance value
as a function of light intensity

## Derating curve

A special version (LDR03/05) with a lower light value is also available.
Type number: B873103/05
Dark value: $\mathrm{R}_{\mathrm{D}} \geqslant 1 \mathrm{M} \Omega$ (measured after 30 sec . in total darkness)
Light value: $\mathrm{R}_{\mathrm{L}}<150 \Omega$
Other data and dimensions are the same as those of the LDR03

## LIGHT-DEPENDENT RESISTORS - LDR

TYPE NUMBER B8 73105

Like type B8 731 03, the LDR05 (B8 73105 ) is virtually a small photoconductive cell. However, it has a different shape and is substantially smaller and lighter. The cell is sealed by means of a special, plastic coating.

| dark value . . . . . . $\mathrm{R}_{\mathrm{D}}=\min .10 \mathrm{M} \Omega$ (measured after 30 min . in total darkness) |  |
| :---: | :---: |
| light value . . . . . $\mathrm{R}_{\mathrm{L}}=75-300 \Omega$ (measured at 1,000 lux) |  |
| recovery rate | $\mathrm{v}=\mathrm{min} .200 \mathrm{k} \Omega / \mathrm{sec}$ |
|  | (i.e. the resistance rise per second at falling light intensity) |
| permissible voltage. | $\mathrm{E}_{\text {max }}=150 \mathrm{~V}_{\text {peak }}$ (provided that $\mathrm{W}_{\text {max }}$ is not exceeded) |
| ambient temperature. | $-30 /+60^{\circ} \mathrm{C}$ |

Light value: $\mathrm{R}_{\mathrm{L}}<150 \Omega$
Other data and dimensions are the same as those of the LDR05
Important: Do not solder closer than 10 mm to the body. Complete soldering and handling instructions available on request.

## LDR - LIGHT-DEPENDENT RESISTORS

TYPE NUMBER B8 73107

The LDR07 is identical to the LDR05 but has no plastic casing. The cell is covered with a special lacquer.

| dark value $\ldots \ldots$ | $\mathrm{R}_{\mathrm{D}}=\min .10 \mathrm{M} \Omega$ (measured after 30 min . in |
| ---: | :--- |
| total darkness |  |

Important: Soldering and handling instructions available on request.

The 2- to 8 -fold connecting blocks can be fixed on to a panel of any desired thickness by means of two screws $3 \mathrm{~mm} \varnothing$.

AA
$A B$
AC

These knobs have been specially designed for professional equipment. Their star feature is the fact that they are fixed by means of a clamping collet. This method renders it superfluous to machine the shaft; it greatly facilitates the fixing and removal of the knobs, and ensures a permanently reliable attachment.

## CONTROL KNOBS - F112 series

THREE DIFFERENT COLOURS

The control knobs series F 112 have been designed for use with equipment in a great variety of classes. Among their main features we mention: - modern styling;

- perfect mounting by means of clamping collet;
- available in black, grey or white.

## GLASS-TO-METAL SEALS - F043 series

## COMPRESSION TYPES

Compression seals are used for hermetically sealing of components. They consist of a tube embedded in the insulating material glass around which a metal outer ring is compressed. The connecting wire has to be led through and soldered to the tube. The compression seal has to be soldered on to the concerning component.

[^47]
## 880. . series - GLASS-TO-METAL SEALS

## MATCHED TYPES

Glass-to-metal seals are used for leading a conductor insulated through the metal envelope of a unit, and, at the same time for hermetically sealing the unit. External influences such as gases, moisture and dust are excluded, and prevalent conditions in the unit as regards vacuum, gas atmosphere or any liquid are rigorously maintained.
Matched-expansion glass-to-metal seals are widely used in both professional equipment and the entertainment sector. Particularly the easy-fitting smaller types are often used as inexpensive feed-throughs, e.g. for channel selectors, without full exploitation of the sealing function. A few further fields of application are: hearing-aids; capacitors; transformers; filters; quartz-crystal units; measuring equipment; computers, and so on.

## GLASS-TO-METAL SEALS - 880.. series

MATCHED TYPES

## 8800. series - SCREENED PLUGS AND SOCKETS

These rigid plugs and sockets have been basically designed for use with microphones and amplifiers. They consist of a moulded synthetic resin body with pins or sockets which are fixed in a strong diecast aluminium can. The contact springs are double acting, offering a four-fold contact guarantee and are of a self-cleaning contact design.

The plugs and sockets are available in three series:
88003 - three-pole according to Fig. 1; $I_{\max } 6$ A
88004 - three-pole according to Fig. 2; $I_{\max } 15 \mathrm{~A}$
88005 - six-pole according to Fig. 3; $I_{\max } 6 \mathrm{~A}$
Permissible voltages:
$\mathrm{E}_{\text {peak }}$ (between two arbitrary contacts) . . 500 V (except between contacts 1 and 2 of series 88003 where $E_{\text {peak }}=350 \mathrm{~V}$. Series 88004 are also suitable for connection to three-phase mains of $3 \times 350 \mathrm{~V}$
Permissible temperature range . . . . . $-40 /+70^{\circ} \mathrm{C}$
Contact resistance . . . . . . . . . . . $\max .3 \mathrm{~m} \Omega$
Insulation resistance . . . . . . . . . . . $\min .15000 \mathrm{M} \Omega$
Parallel damping. . . . . . . . . . . . . $\min .0 .5 \mathrm{M} \Omega$ at $1500 \mathrm{kc} / \mathrm{s}$
Capacitance between contacts and casing . 3-6 pF

## SOCKETS FOR TUBES AND TRANSISTORS

## GENERAL

To ensure the reliability of any electronic equipment, a permanently good electrical contact between tubes or transistors and the circuit is of paramount importance. It is the task of the sockets to provide adequate and lasting contacts. Therefore, very high requirements have to be imposed on their design and qualities, both electrical and mechanical. Even the best tube or transistor will not behave better than its socket will allow it to do!
In service, inferior or wrongly chosen sockets may cause crackling and unduly high losses; when tubes are being inserted into or removed from such sockets, they may even be damaged. Moreover, the dynamic expansion of electronic applications has resulted in a fairly great number of new tube constructions which are used under very divergent and often adverse conditions.
For all these reasons, we have developed a range of first-rate sockets for current tubes and transistors, devoting our best attention to requirements such as high insulation resistance, low capacitance, low losses and ability to withstand high temperatures, shocks and vibrations.

The sockets for radio and TV applications have been designed with the aim to obtain optimum performance at an attractive price. According to the application, the insulating material is either resinbonded paper, synthetic resin or ceramics. Sockets with resin-bonded paper or synthetic resin are suitable for frequencies up to $50 \mathrm{Mc} / \mathrm{s}$. Sockets with ceramic insulating material are suitable for use in humid surroundings; they will give satisfactory results at frequencies up to $500 \mathrm{Mc} / \mathrm{s}$.
All types have been designed for top-chassis mounting. During soldering operations, the sockets should contain either a dummy tube or a wire jig. Earthing of the centre screen greatly reduces the capacitance between contacts. Suitable screen cans are available for miniature and noval sockets.

The sockets for professional applications are employed inter alia in transmitters, telecommunications and industrial equipment. Their construction is extra rigid and provides maximum resistance to arcing and flashovers. A few types have been designed for bottom-chassis mounting. If more than one type of socket is available for a given tube base, the choice depends on the application of the tube.

For transistors, three types of socket are available viz. with 3,4 and 5 contacts. These sockets are made of a synthetic resin which can withstand an ambient temperature of $100^{\circ} \mathrm{C}$.

## DECAL TYPES

## Type E8 70224

Insulating material: ceramic
Number of contacts: 10, silver-plated

## Type B8 70222

Insulating material: ceramic
Number of contacts: 10, silver-plated

## Type B8 70223

Insulating material: ceramic Number of contacts: 10, gold-plated

## Type B8 $702 \mathbf{1 1}$ for p.w.

Insulating material: resin-bonded paper on strips each containing 50 sockets type B8 70211
Number of contacts: 10, silver-plated

Type B8 70086
Insulating material: ceramic Number of contacts: 9

EIGHTAR TYPE

For TV picture tubes, $110^{\circ}$ deflection

Type: B8 70063
Insulating material: resin-bonded paper Number of contacts: 8

## TUBE SOCKETS

Insulating material: mica-filled synthetic resin.
Number of contacts: 12

SUPER JUMBO BASE TYPE

Type 40403
Insulating material: ceramic Number of contacts: 4

## MEDIUM N BASE TYPE

Type 40219
Insulating material: ceramic Number of contacts: 5

## TUBE SOCKETS

MEDIUM BASE TYPE FOR TRANSMITTING, INDUSTRIAL AND SPECIAL TUBES

Type 40222
Insulating material: special plastic Number of contacts: 7

13-PIN TYPE FOR COUNTING TUBES

## Type B8 70067

Insulating material: synthetic resin
Number of contacts: 13

Type B8 700 01/00
Insulating material: synthetic resin Number of contacts: 3

Type B8 70212 (TO18)
Insulating material: synthetic resin Number of contacts: 4

Type Z9 01230
Insulating material: synthetic resin Number of contacts: 5

## AP1001/2 series - IF COILS FOR RADIO (tube sets)

## MINIATURE TYPES FOR AM

The AM coils are adjusted to an IF frequency of 452 or $470 \mathrm{kc} / \mathrm{s}$. There are versions for conventional wiring and for printed wiring. The latter items fit a grid of $\varepsilon=0.1^{\prime \prime}$ or 2.50 mm and a hole diameter of 1.3 mm .

## Available types

AP1001/52, $452 \mathrm{kc} / \mathrm{s}$ convent. wiring AP1001/70, $470 \mathrm{kc} / \mathrm{s}$ convent. wiring AP1002/52, $452 \mathrm{kc} / \mathrm{s}$ printed wiring AP1002/70, $470 \mathrm{kc} / \mathrm{s}$ printed wiring

Mounting spring and aperture for conventional-wiring
 versions.

range of adjustment . . . . . . . $446-483 \mathrm{kc} / \mathrm{s}$
quality factor Q . . . . . . . . 140
quality factor kQ . . . . . . . . 1
maximum working temperature . . $85^{\circ} \mathrm{C}$
The coils for conventional wiring are fixed by means of a wire spring shown in the adjacent figure, which also gives the required mounting aperture; the printed-wiring types are mounted by means of two earthing tags.

## IF COILS FOR RADIO (tube sets) - AP1108 series

## Available types

AP1108/00 (conventional wiring)
AP1108/01 (printed wiring)

Adjustment range .
$10.7 \mathrm{Mc} / \mathrm{s} \pm 7.5 \%$
At $10.7 \mathrm{Mc} / \mathrm{s}$.
$Q_{1}=Q_{2}=110$
$k Q=1.2 \pm 20 \%$

## IF COILS FOR RADIO (transistorized sets) - AP1051 series

## SUBMINIATURE TYPES FOR AM, FM AND AM/FM

The coils are designed for mounting on printed-wiring boards with an $\varepsilon$-grid $=\mathrm{e} / 4=0.635 \mathrm{~mm}$.
They can be supplied with a built-in capacitor (capacitance values 47, 82, 100 or 150 pF ).

## PIECE PARTS FOR SUBMINIATURE IF COILS

The frame core for the coils of the AP1051 series can be supplied separately. For setmakers who wish to make there own miniature (Lilliput) IF coils (series AP1040-AP1045) an assortment of loose piece parts is available.
These piece parts are described in section "Soft magnetic materials" pages G15, G16.

## AP1051 series - IF COILS FOR RADIO (transistorized sets)

## SUBMINIATURE TYPES FOR AM

## Available types:

AP1051/11
Osc. coil
AP1051/15 $1^{\text {st }}$ IF
AP1051/13 $2^{\text {nd }}$ IF
AP1051/14 $3^{\text {nd }}$ IF

## Application

The following performance can be obtained with these coils in the above-given circuit, measured with a supply voltage of -7 V .
a. Sensitivity: Input $2 \mu \mathrm{~V} \pm 6 \mathrm{~dB}$ at $1 \mathrm{Mc} / \mathrm{s}$ for 50 mV audio output. The input is modulated $30 \%$ at $400 \mathrm{c} / \mathrm{s}$. The output is measured across a $5 \mathrm{k} \Omega$ load.
b. Bandwidth: $5.1 \mathrm{kc} / \mathrm{s} \pm 500 \mathrm{c} / \mathrm{s}$ at 6 dB . Measured under similar conditions with a centre frequency of $470 \mathrm{kc} / \mathrm{s}$.
c. Attenuation: $26 \mathrm{~dB} \pm 3 \mathrm{~dB}$ at $\pm 9 \mathrm{kc} / \mathrm{s}$ from centre frequency.
d. Consumption: approx. 3.3 mA .

## SUBMINIATURE TYPES FOR AM FM AND AM/FM

Available types:
AM- AP1051/20
AP1051/22

AP1051/23

FM- AP1051/17
AP1051/19 AP1051/18

Application AM

The following performance can be obtained with these coils in the above-given circuit, measured with a supply voltage of 6 V .
a. Sensitivity: Input $1.6 \mu \mathrm{~V} \pm 6 \mathrm{~dB}$ at $1 \mathrm{Mc} / \mathrm{s}$ for 10 mV audio output. The input is modulated $30 \%$ at $400 \mathrm{c} / \mathrm{s}$. The output is measured unloaded.
b. Bandwidth: $4.8 \mathrm{kc} / \mathrm{s} \pm 500 \mathrm{c} / \mathrm{s}$ at 6 dB . Measured under similar conditions with a centre frequency of $460 \mathrm{kc} / \mathrm{s}$.
c. Attenuation: $77 \times$ at $9 \mathrm{kc} / \mathrm{s}$ from centre frequency.
d. Consumption: approx. 3.3 mA .
e. Max. input: $\mathrm{V}_{\mathrm{b}}$ on first transistor $20 \mathrm{mV}(1 \mathrm{MHz})$
$\mathrm{S}_{1}=$ oscillator $A M$
$\mathrm{S}_{2}=\mathrm{AP} 1051 / 20$
$S_{3}=S_{5}=A P 1051 / 21$
$S_{4}=A P 1051 / 22$
$\mathrm{S}_{6}=\mathrm{AP} 1051 / 23$

## IF COILS FOR RADIO (transistorized sets) - AP1051 series

SUBMINIATURE TYPES FOR AM, FM AND AM/FM
Application FM

$\mathrm{S}_{1}, \mathrm{~S}_{2}, \mathrm{~S}_{3}, \mathrm{~S}_{4}, \mathrm{~S}_{\mathrm{j}},=$ AP1051/17-IF coil
$\mathrm{S}_{6} \quad=$ AP1051/18-Detector coil
$\mathrm{S}_{7} \quad=$ AP1051/19-Detector coil

The following performance can be obtained with these coils in the above-given circuit, measured with a supply voltage of 6 V .
a. Sensitivity: Input $44 \mu \mathrm{~V}$ for 10 mV audio output. The output is measured unloaded. $\Delta \mathrm{f}=15 \mathrm{kc} / \mathrm{s}$.
b. Bandwidth: $160 \mathrm{kc} / \mathrm{s}$ at 6 dB .
c. Attenuation: $450 \times$ at $300 \mathrm{kc} / \mathrm{s}$ from centre frequency.
d. Consumption: approx. 3.3 mA .

## Application AM/FM

## LP1150 series - RF/IF COIL FOR RADIO (transistorized sets)

## MODULE TYPE FOR AM

The module type LP1150 is a miniature fully screened frequency changer and I.F. amplifier designed to cover the medium and long wave bands. It is primarily intended for use in small size radio receivers, but its performance is such that it can be used with advantage in larger receivers.
The first transistor is used as a self oscillating mixer. The second and third transistors provide two stages of I.F. amplification at $450-470 \mathrm{kc} / \mathrm{s}$ using single-tuned circuit I.F. transformers. An OA90 diode provides the A.F. output into a $5 \mathrm{k} \Omega$ load, (normally the volume control of the receiver). An R.F. filter capacitor is provided across this A.F. output.

## Associated circuits

To complete the radio frequency side of a receiver it is necessary to add the aerial circuit, tuning capacitor and wave range switching. The audio output may be applied direct to the volume control whilst the supply voltage is obtained from a 9 V battery, via a decoupling network. The circuit below has been simplified by omitting the wave range switch.

## Connections

1. Oscillator section of tuning gang AC1033
2. Audio output
3. Earth
4. Aerial coil secondary
5. $-7 \vee$ input
6. Earth

## Performance

These figures are based on initial production and may be amended. They are based on a supply voltage, measured at the module, of -7 V .
a. Sensitivity: input $2 \mu \mathrm{~V} \pm 6 \mathrm{~dB}$ at $1 \mathrm{Mc} / \mathrm{s}$ for 50 mV audio output. The input is modulated $30 \%$ at $400 \mathrm{c} / \mathrm{s}$. The output is measured across a $5 \mathrm{k} \Omega$ load.
b. Bandwidth: $5.1 \mathrm{kc} / \mathrm{s} \pm 500 \mathrm{c} / \mathrm{s}$ at 6 dB .

Measured under similar conditions with a centre frequency of $470 \mathrm{kc} / \mathrm{s}$.
c. Attenuation: $26 \mathrm{~dB} \pm 3 \mathrm{~dB}$ at $\pm 9 \mathrm{kc} / \mathrm{s}$ from centre frequency.
d. Consumption: approximately 3.3 mA .

These relays are especially designed for applications which require small dimensions, high reliability, long life, low power and short switching times.
They are in particular suitable for use in telephonesystems, computers, remote-control, data switching and telegraphsystems, measuring apparatus, logiccircuits, television, etc. The relays are housed in a hermetically sealed metal can, switch in a well defined gas atmosphere and have good shock and vibration proparties.

They can be supplied in two versions:
Type SZC7122. A bistable type with one change-over contact. This version has two normal positions. Type SZC7123. A monostable type with one change-over contact. This version has one normal position. To keep the make-contact closed, the relay must be energized.

When relay type SZC7122 is energised according to the figure, terminals 2 and 6 are interconnected; in the opposite direction terminals 2 and 1 are interconnected.

When relay type SZC7123 is energised, terminals 2 and 6 are interconnected.

## SZC series - POLARIZED RELAY

## MINIATURE TYPE

## Winding data

| version | winding | terminals |  | number <br> of turns | wire <br> diam. | resistance <br> $25^{\circ} \mathrm{C}(\Omega)$ | type number |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | end |  |  |  |  |  |
| bistable | I | 5 | 3 | 2400 | 0.05 mm | 290 | SZC7122 |
| monostable | II | 8 | 7 | 2400 | 0.05 mm | 400 |  |
|  | I | 5 | 3 | 2400 | 0.05 mm | 290 | SZC7123 |
|  | II | 8 | 7 | 2400 | 0.05 mm | 400 |  |

The tolerance on the winding resistance is $\pm 15 \%$.

## Ampere turns

|  |  |  |  |  |  |  | bistable relay |
| :--- | :--- | :--- | :--- | :--- | :--- | :---: | :---: |
| operate. | . | . | . | . | . | . | 35 AT |
| release. . | . | . | . | . | . | . | - |
| non operate | . | . | . | . | . | . | 10 AT AT relay |
| hold . . . . | . | . | . | . | . | - | 6 AT |

Life of contacts $\ldots \ldots>10^{7}$ contact operations.

## Switching times.

1. Operate time of closed contact.

This time depends on the energizing AT, operate AT and the total power in the energizirg circuit and may vary from

$$
0.3-1.5 \mathrm{msec} \text { (monostable type) }
$$

and $0.15-0.6 \mathrm{msec}$ (bistable type),
e.g.

| circuit dissipation | 500 mW | 100 mW |
| :---: | :---: | :---: |
| $\frac{\text { energizing AT }}{\text { operate } A T}$ | 2 | 1.1 |
| monostable type . . . | approx. 0.3 msec | approx. 1.5 msec |
| bistable type . . . . | approx. 0.15 msec | approx. 0.6 msec |

2. Change-over time. This time also depends on the energizing AT, operate AT and the total power in the energizing circuit, and lies between 0.25 and 0.6 msec .
3. Bounce time $\leq 0.3 \mathrm{msec}$ at $90 \%$ of the relays of a batch.

## INTRODUCTION

## CLASSIFICATION

A correctly chosen loudspeaker is essential to obtain adequate acoustic results from electro-acoustic equipment. The following factors should be considered.

Shape, size and attachment, with reference to the available space.
Quality and sensitivity, which compromise between fidelity of reproduction and price.

The frequency-response characteristic in relation to the kind of application.
Impedance and power-handling capacity, which should be adapted to the output stage of the equipment.

## Appearance and finish.

To facilitate your making a choice from our programme of loudspeakers, all the basic types are tabulated on page 51. The explanations given in the rest of this introduction apply to the entire programme and, therefore, they are not repeated in the specifications.

## Midget speakers

As their name indicates, the midget speakers have minor dimensions and, particularly, very small depth. Nevertheless they have a remarkable sensitivity and, thanks to this circumstance and to the special Z-version frequency-response characteristics, they are extremely suitable for transistorised radio sets such as portable, pocket-size and personal equipment.

## Standard speakers

The standard speakers are by far the most extensive group. As a consequence of the diversity in characteristics and size, they are suitable for sets of all kinds, AM, FM, TV, car radio, electrophones, tape recorders, sound columns, consoles, etc. in all the various price classes.

Almost any size is available in two or more sensitivity classes (I, II, III and IIIA) according as a magnet system of 6800,8500 or 9500 gauss is used ; the difference in acoustic output between consecutive classes is 3 dB .

The TICONAL magnet systems class I, II and III have remarkably weak leakage fields.
The classes III and IIIA are identical as regards their high quality, but the IIIA speakers have a smaller depth thanks to the use of flat ferroxdure magnet rings. Therefore, they are appropriate for larger-size transistor equipment such as table-type radio sets, carradio sets, gramophones and tape recorders.

The fairly appreciable difference in price between the various classes allows of choosing the required compromise between price and quality for any individual application.

## High-quality speakers

The high-quality speakers have been specially designed for use in Hi-Fi equipment, where a high power-handling capacity, a very wide frequency-range and a negligible distortion level are required. Examples of application: acoustic boxes, bass-reflex boxes, juke boxes, Hi -Fi enclosures, with and without cross-over network and stereo columns.

## Special speakers

The special speakers have specific applications. (see fage F85)

## ATTACHMENT

All the loudspeakers conform to the recommendations of the E.I.A. (Electronic Industries Association, formerly RETMA).

## QUALITY LEVEL

Thanks to the use of superior TICONAL or ferroxdure magnets of outstanding materials for cone and centre ring, as also to the rugged construction featuring a closetolerance air-gap, the quality of each type of speaker complies with the most exacting requirements.

## FINISH

The loudspeakers are tropic-proof and they are cadmium-plated so as to prevent any corrosion.

## DERIVATIVE TYPES

Each basic type may have one or more derivative versions as regards acoustic characteristics and voice-coil impedance.

## M-VERSION (bicone speakers)

These speakers are equipped with an extra high-note cone inside the normal one. This results in remarkable perfection of reproduction, the frequency range being expanded from about $10 \mathrm{kc} / \mathrm{s}$ to some $20 \mathrm{kc} / \mathrm{s}$, and the spatial sound-distributions being made more uniform.

At high frequencies the normal cone suffers from the "breaking-up" effect, which means that not all parts vibrate in phase any longer: the entire cone area cannot follow the quick vibrations as a consequence of inertia; several parts will vibrate out of phase and so counteract each other. At rising frequency the effective area is even more restricted to the apex region of the cone, and a steadily decreasing acoustic output is the result.

Glueing a small and fairly stiff extra cone inside the apex of the normal cone enlarges the radiating surface at high frequencies, and hence improves the high-note reproduction.

The extra cone furthermore acts as a sound diffuser at frequencies up to about $10 \mathrm{kc} / \mathrm{s}$, the range of the normal cone. Beyond this frequency the small cone gradually takes over from the larger one, the latter then acting as a high-note reflector.
Applications are, inter a!ia, Hi-Fi equipment, stereo enclosures, TV receivers and FM radio sets.

## X-VERSION

The speakers of this version have been specially designed for medium-class receivers that can reproduce only a limited frequency range.
By employing special cone-techniques, it was found possible to obtain an increased sensitivity in the region of maximum earsensitivity ( $1-4 \mathrm{kc} / \mathrm{s}$ ). Between $1.4 \mathrm{and} 6 \mathrm{kc} / \mathrm{s}$ the frequency characteristic shows a so-called forwardness or presence peak of about 5 dB , making the sound very clear and open.

## Y-VERSION

For less powerful AM/FM receivers such as battery sets, where high-note distortion is likely to occur, the speakers of this version are very suitable.

The sensitivity in the region of $1-4 \mathrm{kc} / \mathrm{s}$ is further increased, and frequencies beyond $6 \mathrm{kc} / \mathrm{s}$ are suppressed. A presence peak of 7-8 dB improves the sound quality to a fair level.

## Z-VERSION

These speakers have a major sensitivity in the medium range and, for cone diameters up to $4^{\prime \prime}$, a frequency cut-off at $3.5-4 \mathrm{kc} / \mathrm{s}$ so as to avoid the noise that accompanies the higher frequencies. In the case of a larger cone diameter, the reproduction of the higher frequencies is attenuated.
Z-version speakers are extremely suitable for transistorised sets.

## IMPEDANCE

In addition to the low-ohmic basic types, the loudspeakers are available in high-ohmic versions which may be desirable in the case of a transformerless output stage.
Standard high-ohmic versions are the following.

| A $(800 \Omega)$, | H $(25 \Omega)$, |
| :--- | :--- |
| C $(150 \Omega)$, | $\mathrm{P}(15 \Omega)$, |
| G $(100 \Omega)$, | $\mathrm{S}(8 \Omega)$, |
| K $(60 \Omega)$, | $\mathrm{R}(4 \Omega)$. |

## PREFERRED TYPES

Speakers with type numbers in bold print are as a rule available at shorter notice than the other types.

Non-listed items can be supplied on request.

## GENERAL

On the following pages you will find the frequency-response curves of all low-ohmic types. These curves are measured under the following conditions:

1. recorded in anechoic room;
2. without baffle;
3. microphone in axis of loudspeaker at a distance of 50 cm ;
4. input 50 mW at $400 \mathrm{c} / \mathrm{s}$;
5. constant voltage.

Comparing a constant-current characteristic of any loudspeaker with a constant-voltage one, we find the latter flatter in the region of the resonance frequency, whereas it drops more abruptly at the higher frequencies. The reason is as follows.
The power which moves the coil and the cone is proportional to the current through the coil. In the case of constant voltage, the current will decline in the neighbourhood of the resonance frequency and at higher frequencies as a consequence of rising coil impedance. The result is dropping sound pressure in these frequency regions.

The frequency ranges indicated on the obsolete EP-sheets relate to older constantcurrent measurements and, hence, do not relate to the response curves depicted here.

## THE USE OF RESPONSE CHARACTERISTICS

First of all we wish to emphasise that these curves should be used exclusively for comparison.

Never compare curves which are not based on one and the same measuring method (identical measuring equipment, measuring room, distance, power input and, even, identically mounted speakers). Only experienced experts are able to compare response curves not based on exactly identical conditions. Also the condition of the anechoic chamber may greatly affect the results.
Contrary to many other manufacturers, frequency characteristics for loudspeakers were determined without a baffle.

## THE FREQUENCY CHARACTERISTICS FOR MAKING COMPARISONS

The response curve does help us to disclose differences in reproduction quality. The comparison of curves determined under identical conditions may give a picture of a few acoustical aspects. A difference in level means a difference in sensitivity (efficiency) in various frequency regions. A difference in width means a difference in frequency range.
We should never forget, however, that the curves represent the sound pressure only in the centre of a circular plane. Since the sound pressure is not uniformly distributed over the plane and not in the same manner in various cases, the sound impression may differ more than the response curves suggest.
It will be evident that a high degree of expertness is required to interpret the differences in response curves. For the greater part, this expertness is gained through experience.

## FREQUENCY CHARACTERISTICS AN AID FOR MANUFACTURERS

Response curves play a great part in the development of loudspeakers, pinpointing their acoustic characteristics, their manufacture and production checks.
For a major part, the acoustic characteristics are bound up with the moving parts of a speaker, i.e. the coil, centring ring and cone. For the development engineer it is but a small problem to establish what response curve is required for an equipment under development. Furthermore, if the acoustic reproduction is not yet up to the requirements, it is a fairly simple matter for them to subject the speaker to slight modifications, based on the frequency curve, and to examine the effect with the help of the curve. For loudspeakers in production, the frequency characteristic is an excellent means to check the reproduction quality and, at the same time, the sensitivity of the magnet system. As regards less experted customers, great caution should be exercised as for use and interpretation of the curves.

## 3" MIDGET LOUDSPEAKERS

## Primary applications:

portable radios and other transistorised cordless sets.

## Specific properties:

1. Small depths owing to a flat magnet of powerful ferroxdure.
2. The frequency-response curve displays a pronounced presence peak in the region of maximum ear sensitivity.

Main dimensions:

```
mounting diameter . . . . . . }92\textrm{mm
outer diameter . . . . . . . . }80.2\textrm{mm
total depth max. . . . . . . . }27.2\textrm{mm
```

## 4" MIDGET LOUDSPEAKERS

## AD3416

## Primary applications:

cordless radio sets;
small tape recorders.

## Specific properties:

1. Favourable compromise between features such as high acoustic output, reduced mounting depth and low weight.
2. Powerful ferroxdure magnet.
3. The frequency-response curve displays a pronounced presence peak in the region of maximum ear sensitivity.

## Main dimensions:

mounting diameter . . . . . . 119 mm
outer diameter. . . . . . . . 105.2 mm
total depth max. . . . . . . . 29.3 mm

## 4" MIDGET LOUDSPEAKERS

#### Abstract

\section*{Specific properties:} 1. Frequency range suitable for both $A M$ and $F M$ reception in transistorised sets. They combine the advantages of our Z-type cones with a frequency limit of $7.8 \mathrm{kc} / \mathrm{s}$, which was found to be the best compromise to ensure satisfactory results in both systems.

2. Small depth owing to flat ferroxdure magnet.

## 4" MIDGET LOUDSPEAKERS

## AD3414

## Primary application:

high-quality cordless radio sets

## Specific properties:

1. These class-IIIA speakers are particularly suitable for high-performance cordless radio sets.
2. Extremely sensitive ferroxdure magnet, which converts even small output signals into a sound of fair volume.
3. The resonance frequency has been adapted to the average size of smaller sets so as to obtain optimum bass reproduction.

Main dimensions:
mounting diameter . . . . . . 115 mm
outer diameter. . . . . . . . 95.2 mm
total depth max. . . . . . . . 42.2 mm

## 4" MIDGET LOUDSPEAKERS

AD3415

## Primary application:

cordless radio sets
(in particular for AM/FM reception)

## Specific properties:

1. Owing to the large and flat square magnet of ferroxdure and the X-version cone, these speakers combine high sensitivity and appreciable presence with a small depth.
2. Sensitivity equals that of type AD3414Z, but the wider frequency range renders these speakers suitable for AM/FM sets.

Main dimensions:

$$
\text { outer diameter . . . . . . . . } 105.2 \text { mm }
$$

$$
\text { total depth } \max . . . . . . . .41 .1 \mathrm{~mm}
$$

## 3" STANDARD LOUDSPEAKERS

## AD1300-06

## Primary applications:

small radio receivers;
intercoms; TV tweeters.

## Specific properties:

1. Thanks to the pronounced high-note reproduction the AD1300 is quite suitable for use as high-note projector at the front of receivers.
2. The Z-version is outstandingly suited to obtain clear reproduction of the human voice.

Main dimensions:
mounting diameter . . . . . . 92 mm
outer diameter. . . . . . . . 80.2 mm
total depth max. . . . . . . . 42.8 mm

## 4" STANDARD LOUDSPEAKERS

## AD1400-06

## Primary applications: <br> AM/FM radio sets; <br> tape recorders; electrophones.

## Specific property:

As a consequence of the raised response in the mediumnote region, the Z -version items are outstandingly suited to obtain clear reproduction of the human voice. Therefore, they are widely used for dictaphones.

Main dimensions:
mounting diameter . . . . . 115 mm
outer diameter. . . . . . . . 105.2 mm
total depth max. . . . . . . . 50 mm

| power- <br> handling <br> capacity <br> (W) | impedance <br> at $1 \mathrm{kc} / \mathrm{s}$ <br> $(\Omega)$ | total <br> resonance <br> frequency <br> $(\mathrm{c} / \mathrm{s})$ | magnetic <br> flux <br> $(M x)$ | flux <br> density <br> $(G)$ | weight <br> $(g)$ | type number |

## 4" STANDARD LOUDSPEAKERS

AD2400-06

## Primary applications:

AM/FM radio sets; tape recorders; electrophones; TV tweeters (AD2400M-06).

## Specific property:

Type AD2400M/06 is particularly suitable for use as a highnote projector (tweeter) at the front of radio- and TVreceivers.

Main dimensions:
mounting diameter . . . . . . 115 mm
outer diameter. . . . . . . . 105.2 mm
total depth max. . . . . . . . 62 mm

| power- <br> handling <br> capacity <br> $(W)$ | impedance <br> at 1 $\mathrm{kc} / \mathrm{s}$ <br> $(\Omega)$ | total <br> resonance <br> frequency <br> $(c / \mathrm{s})$ | magnetic <br> flux <br> $(M x)$ | flux <br> density <br> $(G)$ | weight <br> $(\mathrm{g})$ | type number |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## 5" STANDARD LOUDSPEAKERS

## AD1500-06

## Primary application:

all kinds of radio and TV sets.

## Specific properties:

See section "Introduction", standard speakers, p. 46.

Main dimensions:
mounting diameter . . . . . . 119 mm
outer diameter. . . . . . . . 121 mm
total depth max. . . . . . . . 51.5 mm

| power- <br> handling <br> capacity <br> (W) | impedance <br> at 1 kc/s <br> $(\Omega)$ | total <br> resonance <br> frequency <br> $(\mathrm{c} / \mathrm{s})$ | magnetic <br> flux <br> $(M x)$ | flux <br> density <br> $(G)$ | weight <br> $(g)$ | type number |

| 6 | 3 | 130 | 15800 | 8500 | 250 | AD2500X-06 |

## 5" STANDARD LOUDSPEAKERS

## AD3500-06

## Primary applications:

all kinds of radio and TV sets

## Specific properties:

1. The $800 \Omega$ type, obtained by applying a special method of winding the voice coil, can be used in conjunction with a single-ended transformerless output stage.
2. High sensitivity.
3. See section "Introduction", standard speakers p. 46.

Main dimensions:
mounting diameter . . . . . . . 119 mm
outer diameter. . . . . . . . . 121 mm
total depth max. . . . . . . . . 68 mm

| powerhandling capacity (W) | impedance at $1 \mathrm{kc} / \mathrm{s}$ ( $\Omega$ ) | resonance frequency (c/s) | total magnetic flux (Mx) | flux density <br> (G) | weight <br> (g) | type number |

## $4^{\prime \prime} \times 6^{\prime \prime}$ STANDARD LOUDSPEAKERS

## AD3464

## Primary applications:

equipment in which little space is available, such as taperecorders, magnetophones and car radios.

## Specific properties:

1. Flat but, nevertheless, very sensitive loudspeaker magnet system owing to the small height of its annular ferroxdure magnet.
2. The acoustic output of the class-IIIA speakers AD3464 equals that of the class-III types AD3460-06 provided with a TICONAL magnet.

Main dimensions:
mounting diameter . . . $117.5 \times 92 \mathrm{~mm}$
outer diameter. . . . . $155 \times 103 \mathrm{~mm}$
total depth max. . . . . . . 52.8 mm

## $5^{\prime \prime} \times \mathbf{7}^{\prime \prime}$ STANDARD LOUDSPEAKERS

## AD3570-06

## Primary application:

all kinds of radio and TV sets.

## Specific properties:

1. Oval class-III types designed for use in those cases where the available space prohibits the accommodation of round class-III speakers AD3700.
2. High acoustic output owing to the powerful TICONAL magnet.

Main dimensions:
mounting diameter . . . $110 \times 110 \mathrm{~mm}$ outer diameter. . . . . . $183 \times 133 \mathrm{~mm}$ total depth max. . . . . . . . 78.3 mm

## $6^{\prime \prime} \times 9^{\prime \prime}$ STANDARD LOUDSPEAKERS

AD3690-06

## Primary applications:

AM/FM and TV sets; radiogramophones.

## Specific properties:

1. The $800 \Omega$ type, obtained by applying a special method of winding the voice coil, can be used in conjunction with a single-ended transformerless output stage.
2. High sensitivity.
3. See section "Introduction", standard speakers, p. 46.

Main dimensions:
mounting diameter . . $166.7 \times 117.5 \mathrm{~mm}$ outer diameter . . . . $233.6 \times 160.6 \mathrm{~mm}$ total depth max. . . . . . . . 88.3 mm

## 6.5" SPECIAL LOUDSPEAKERS

AD3701

## Primary application:

small closed cabinets for monophonic and stereophonic reproduction (see page F95).

## Specific properties:

1. Hi-Fi reproduction over a very wide frequency range owing to the use of a special double cone which has a very low resonance frequency and reproduces even the highest tones so as to ensure a true timbre.
2. Great power-handling capacity when placed in a closed cabinet having a volume of about 25 litres.
3. Very high sensitivity owing to the use of a large annular ferroxdure magnet.

| powerhandling capacity (W) | impedance at $1 \mathrm{kc} / \mathrm{s}$ ( $\Omega$ ) | resonance frequency (c/s) | ```total magnetic flux (Mx)``` | flux density <br> (G) | weight <br> (g) | type number |

| 10 | 800 | 55 | 42600 | 9500 | 525 | AD3701AM |

## 6.5" SPECIAL LOUDSPEAKERS

## AD3721

## Primary application

equipment in which little space is available, such as taperecorders and electrophones.

## Specific properties:

1. These wafer types have a space-saving shape and a small mounting depth.
2. High acoustic efficiency nothwithstanding the small mounting depth owing to the sensitive flat ferroxdure magnet.
3. Flat wafer design

Main dimensions:
mounting diameter . . . . . . 156 mm
outer diameter. . . . . . . . 166.6 mm
total depth max. . . . . . . 41.1 mm

| power- <br> handling <br> capacity <br> (W) | impedance <br> at $1 \mathrm{kc} / \mathrm{s}$ <br> $(\Omega)$ | resonance <br> frequency <br> $(\mathrm{c} / \mathrm{s})$ | total <br> magnetic <br> flux <br> $(M x)$ | flux <br> density <br> $(G)$ | weight <br> $(\mathrm{g})$ | type number |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 3 | 5 | 110 | 28200 | 9500 | 500 | AD3721 |

## Primary application:

TV sets.

## Specific properties:

1. These speakers (otherwise identical to type AD3721) are equipped with a leakage-compensation assembly composed of a screening bracket and two compensation magnets, which almost completely neutralise the leakage field of the loudspeaker magnet. In view of the compactness of TV receivers this is of paramount importance to prevent the speakers - close to the picture tube - from affecting the image quality.

2. Flat wafer design, greatly facilitating accommodation of these speakers in TV sets.
3. The sensitive flat ferroxdure magnet ensures a high efficiency.

Main dimensions:
mounting diameter . . . . . . 156 mm
outer diameter. . . . . . . . 166 mm
total depth max. . . . . . . . 41.1 mm

| power- <br> handling <br> capacity <br> (W) | impedance <br> at 1 $\mathrm{kc} / \mathrm{s}$ <br> $(\Omega)$ | resonance <br> frequency <br> $(\mathrm{c} / \mathrm{s})$ | total <br> magnetic <br> flux <br> $(M x)$ | flux <br> density <br> $(G)$ | weight |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $(\mathrm{g})$ |  |  |  |  |  |$\quad$ type number

## 6.5" SPECIAL LOUDSPEAKERS

## AD3729

## Primary application:

TV sets.

## Specific properties:

1. Small mounting depth as a result of the inverted construction.
2. High sensitivity (class III) owing to the use of a TICONAL GG magnet.
3. Absence of a stray field, an essential condition to obviate any influence on the picture tube.
4. The $M$-version speakers have a wide frequency range.

When the speakers, which are supplied in a plastic envelope, are built in, the front must be covered with a piece of muslin so as to prevent dust from entering the air gap.

Main dimensions:
mounting diameter . . . . . . 156 mm
outer diameter. . . . . . . . 155 mm
total depth max. . . . . . . . 46.9 mm

| power- <br> handling <br> capacity <br> (W) | impedance <br> at $1 \mathrm{kc} / \mathrm{s}$ <br> $(\Omega)$ | resonance <br> frequency <br> $(\mathrm{c} / \mathrm{s})$ | total <br> magnetic <br> flux <br> $(\mathrm{Mx})$ | flux <br> density <br> $(G)$ | weight <br> $(g)$ | type number |

| 3 | 4 | 100 | 18900 | 7000 | 250 | AD3729RX |

## 12" SPECIAL LOUDSPEAKERS

AD4201

## Primary applications:

juke boxes;
acoustic boxes for musical installations.

## Specific properties:

1. New type of inexpensive speaker with a reasonably good efficiency, well suitable for those installations where both cost and quality are factors of importance.
2. The $M$-version is suited to stereo reproduction because of its wide frequency range.

Main dimensions:
mounting diameter . . . . . . . 294 mm
outer diameter. . . . . . . . . . 314.3 mm
total depth max. . . . . . . . . . 122.7 mm

| power- <br> handling <br> capacity <br> $(W)$ | impedance <br> at $1 \mathrm{kc} / \mathrm{s}$ <br> $(\Omega)$ | resonance <br> frequency <br> $(\mathrm{c} / \mathrm{s})$ | total <br> frequency <br> range <br> $(c / s)$ | magnetic <br> flux <br> $(M x)$ | flux <br> density <br> $(G)$ | weight | type number |

## 8" HIGH-QUALITY LOUDSPEAKERS

## AD4800

## Primary applications:

$\mathrm{Hi}-\mathrm{Fi}$ and stereo equipment;
type AD4800 is suitable for low-note reproduction, such as required for acoustic and bass-reflex boxes, and for low and medium note reproduction in cross-over networks.

## Specific properties:

1. When these speakers are placed in an acoustic box or any other enclosure, their sensitivity and response qualities result in an almost constant sound pressure over the entire audible frequency range.
2. Optimum sound volume.
3. Practically undistorted sound reproduction.

Main dimensions:
mounting diameter . . . . . . 194 mm
outer diameter. . . . . . . 205.6 mm
total depth max. . . . . . . . 118.3 mm

| power- <br> handling <br> capacity <br> (W) | impedance <br> at $1 \mathrm{kc} / \mathrm{s}$ <br> $(\Omega)$ | resonance <br> frequency <br> $(\mathrm{c} / \mathrm{s})$ | total <br> frequency <br> range <br> $(\mathrm{c} / \mathrm{s})$ | magnetic <br> flux <br> $(M x)$ | flux <br> density <br> $(\mathrm{G})$ | weight <br> $(\mathrm{kg})$ | type number |

## 8.5" HIGH-QUALITY LOUDSPEAKERS

9710-01

## Primary application:

$\mathrm{Hi}-\mathrm{Fi}$ equipment.

## Specific properties:

1. Eminently suitable for use in all kinds of Hi -Fi equipment owing to their outstanding reproduction of world-wide fame.
2. Particularly large air gap, resulting in the voice coil being completely enclosed by a uniform magnetic field even at the largest amplitudes. No distortion will thus be experienced due to the coil amplitude being disproportional to the current.
3. Constant voice-coil impedance throughout the entire frequency range, so that the output stage always has a perfectly matched load.
4. Very smooth response curves owing to the improved cone design.
5. Clear bass response without boom effects, because of the mechanical damping at low frequencies.

Main dimensions:
mounting diameter . . . 203.2 mm
outer diameter. . . . . 216.5 mm
total depth max. . . . . 111.6 mm

| power- <br> handling <br> capacity <br> $(W)$ | impedance <br> at $1 \mathrm{kc} / \mathrm{s}$ <br> $(\Omega)$ | resonance <br> frequency <br> $(c / s)$ | total <br> frequency <br> range <br> $(c / s)$ | magnetic <br> flux <br> $(M x)$ | flux <br> density <br> $(G)$ | weight |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $(\mathrm{kg})$ |  |  |  |  |  |  |$\quad$ type number

## 10" HIGH-QUALITY LOUDSPEAKERS

AD4000

Main dimensions:
mounting diameter . . 244 mm
outer diameter . . . . 261.3 mm
total depth max. . . . . 136.5 mm

## Primary applications:

Hi Fi and stereo equipment; radiograph consoles.

## Specific properties:

1. Outstanding quality of reproduction, rendering these types suitable for use in all kinds of Hi-Fi equipment.
2. Particularly large air gap, resulting in the voice coil being completely enclosed by a uniform magnetic field even at the largest amplitudes. No distortion will thus be experienced due to the coil amplitude being disproportional to the current.
3. Constant voice-coil impedance throughout the entire frequency range, so that the output stage always has a perfectly matched load.
4. Very smooth response curves owing to the improved cone design.
5. Clear bass response without boom effects, because of the mechanical damping at low frequencies.

## 12" HIGH-QUALITY LOUDSPEAKERS

AD4200

## Primary application:

$\mathrm{Hi}-\mathrm{Fi}$ installations

## Specific properties:

1. High power-handling capacity.
2. Particularly large air gap, resulting in the voice coil being completely enclosed by a uniform magnetic field even at the largest amplitudes. No distortion will thus be experienced due to the coil amplitude being disproportional to the current.
3. Constant voice-coil impedance throughout the entire frequency range, so that the output stage always has a perfectly matched load.
4. Very smooth response curves owing to the improved cone design.
5. Clear bass response without boom effects, because of the mechanical damping at low frequencies.
6. The acoustic output of types AD4200 is 3 dB lower than that of types AD5200.

Main dimensions:
mounting diameter . . . 294 mm
outer diameter . . . . . 314.3 mm
total depth max. . . . . 155.6 mm

| power- <br> handling <br> capacity <br> (W) | impedance <br> at 1 $\mathrm{kc} / \mathrm{s}$ <br> $(\Omega)$ | resonance <br> frequency <br> $(\mathrm{c} / \mathrm{s})$ | total <br> frequency <br> range <br> $(\mathrm{c} / \mathrm{s})$ | magnetic <br> flux <br> $(M x)$ | flux <br> density <br> $(G)$ | weight <br> $(\mathrm{kg})$ | type number |

## ALL-ROUND ACOUSTIC BOX WITH SOUND REFLECTOR

## Technical data

The all-round acoustic box is supplied in two styles, suitable for any interior: in smart pearl grey imitation leather, and elegant beech veneer.

| Frequency range | $60-18000 \mathrm{c} / \mathrm{s}$ |
| :---: | :---: |
| Bass-resonance. | $70 \mathrm{c} / \mathrm{s}$ |
| Power-handling capacity of the |  |
| loudspeaker | 10 W without audible |
|  | distortion if mounted in a closed |
|  | cabinet having a volume of |
|  | approx. 25 litres |

Type numbers:
AD5043/S (3-8 $\Omega$ ). . . in pearl grey imitation leather AD5043/M (3-8 $\Omega$ ) . . in beech veneer

## The only tool you need

In order to avoid damage to the various components, the all-round acoustic box is supplied only partially assembled. Assembly is very simple. Clear instructions are enclosed. You can assemble a complete, ready-to-use all-round acoustic box in a few minutes without any special tools. All you need is a screwdriver to fix the seventeen supplied screws into pre-drilled holes.

AD5201

Notwithstanding the design of the AD5201 being based on the normal electrodynamical principle, a number of striking features make it unique in its kind. The use of new materials and techniques allowed the development of a Hi-Fi speaker which, in conjunction with high and medium-note speakers and housed in an acoustically adequate enclosure, will be found a major contribution towards natural sound reproduction.
Because of its specific design and characteristics, this speaker is a solitary in our programme.

The AT crystals in HC-6/U and HC-18/U holders mentioned in the tables satisfy the requirements of the military specification MIL-C-3098B.

The crystals in all-glass holders HC-27/U satisfy MIL-C-3098C.
They have the following outstanding properties:
a. reduced liability to aging effects;
b. close frequency tolerances at the nominal temperature can be achieved;
c. lower series resistance, thanks to the crystal's working in vacuum.

## When applying for quotation or when ordering, please state:

|  |  | fundamental |
| :---: | :---: | :---: |
| 1. nominal frequency | ....kc/s, mode of vibration: | third |
|  |  | fifth |
| 2. a. frequency tolerance | $\ldots \times 10^{-6}$, or |  |
| b. adjustment tolerance | $\ldots \times 10^{-6}$, and |  |
| frequency drift | $\ldots \times 10^{-6}$. |  |

3. temperature range.
4. a. parallel resonance, capacitance parallel to unit:...pF, or
b. anti-resonance, capacitance in series to unit $: .$. .pF, or
c. series resonance.
5. type of holder.

For non-listed types, please apply in the same manner and submit oscillator circuit with description.

## VARIABLE TRANSFORMERS - E401 series

GENERAL

These transformers have been designed for controlling line voltages.
The output can be varied from zero to approximately $15 \%$ above the line voltage.
They consist of a toroidal coil wound on a laminated annular core. The insulation of each turn is partly stripped to form a contact track for the slider. The coil has up to three taps: one at each end at $18 \%$ of the total turns and one centre tap.
The slider contact can be easily removed.

## General Data:

Rated input voltage . . . . . . . . . . . . . . 130, 220 and $240 \mathrm{~V}_{\mathrm{ac}}+5 \%$
Frequency
$50 . .400 \mathrm{c} / \mathrm{s}$
Rated current

## E401 series - VARIABLE TRANSFORMERS

## MOTOR DRIVE MODULE

Pinion set type 84543 for matching the entire AU5300/80. . series of gearboxes to the motor drive.

Panel model E401KB/080 with motor drive.

A motor drive module is available for most of the E401 series variable transformers, either stacked or individual. Two types of motor combined with a choice of gearboxes can rotate the variable transformers over $320^{\circ}$, from limit to limit, in 6, 15, 30, or 60 sec.

Protective-cover set.

## VARIABLE TRANSFORMERS - E401 series

MOTOR DRIVE MODULE
A motor-driven variable transformer, either stacked or individual, can be build up of the following parts:

[^53]
## E401 series - VARIABLE TRANSFORMERS

## MINIATURE TYPE 0.7 A

The miniature transformers are molded in reinforced polyester resin. The construction is rugged and professional. The mounting hole pattern is simple, the support area is relatively wide, and the transformers are light enough to be mounted on thin chassis or panels.

## Type number: 2P 25050

The spindle of this model is adjustable in length protruding at both sides. A different spindle of suitable length can be fitted.

| Max. input voltage | $240 \mathrm{~V}+5 \%$ (connected to $\mathrm{K}-\mathrm{N}$ ) |
| :---: | :---: |

| Max. permissible temp. rise at any point. | $70^{\circ} \mathrm{C}$ |

## E401 series - VARIABLE TRANSFORMERS

## Type E 401 ZZ

Some of these transformers are wound in two layers. The slide contact tracks only the upper layer and so only one half of the primary voltage is tapped.

## FERROXCUBE 3 \& 4

## SURVEY OF SYMBOLS

$I_{e}$
length of the magnetic path in cm
$\mathrm{A}_{e}$. . . . . . . . . cross-section of a homogeneous part of the core in $\mathrm{cm}^{2}$
$\mu_{i}$. . . . . . . . . relative initial permeability, defined by:

$$
\mu_{i}=\lim _{\mathrm{H} \rightarrow 0} \frac{\mathrm{~B}}{\mathrm{H}}
$$

$$
\mu_{e}=\frac{\sum \frac{\mathrm{I}}{\mathrm{~A}}}{\sum \frac{\mathrm{I}}{\mu_{i} \mathrm{~A}}}
$$

$V_{e}$. . . . . . . . . effective volume of a potcore in $\mathrm{cm}^{3}=$ volume of an ideal toroid in the same material grade and with the same magnetic properties as the potcore. $V_{e}$ is calculated by:

$$
\mathrm{V}_{e}=\frac{\left(\Sigma \frac{\mathrm{I}}{\mathrm{~A}}\right)^{3}}{\left(\Sigma \frac{\mathrm{I}}{\mathrm{~A}^{2}}\right)^{2}} \mathrm{~cm}^{3}
$$

$\Delta$
length of the air gap in mm
$\alpha$
turns factor $=$ number of turns for 1 mH
$A_{L}$. . . . . . . . . inductance factor $=$ inductance for one turn in nanohenry $\left(10^{-9} \mathrm{H}\right)$
$\widehat{H}$
peak field strength in oersted
$\widehat{B}$
peak induction in gauss

AT . . . . . . . . . amperes $\times$ turns
T.F. $=\frac{1}{\mu^{2}} \cdot \frac{\mathrm{~d} \mu}{\mathrm{dT}} \cdots$ temperature factor $=$
value for a certain ferroxcube material over a certain temperature range. In order to calculate the temperature coefficient per ${ }^{\circ} \mathrm{C}$ of a coil the temperature factor has to be multiplied by the effective permeability.

So

$$
\text { t.c. }=\frac{\Delta \mu}{\mu_{i}} \times \frac{\mu_{e}}{\mu_{i}}=\frac{\Delta \mu}{\mu_{i}{ }^{2}} \times \mu_{e} \operatorname{per}^{\circ} \mathrm{C}
$$

## FERROXCUBE 3 \& 4

## SURVEY OF SYMBOLS

D.F. $=\frac{\mu_{1}-\mu_{2}}{t_{2}}$. . disaccommodation factor, which gives the permeability varia$\mu_{1}{ }^{2} \log \frac{t_{2}}{t_{1}}$ tion of the core, measured between 10 and 100 minutes after demagnetization.

Curie point . . . . . critical temperature in ${ }^{\circ} \mathrm{C}$ above which the ferromagnetic body is paramagnetic.
$\frac{\tan \delta}{\mu_{i}} \cdots \cdots \begin{aligned} & \text { constant for eddy current and residual losses togethe } \\ & \text { tain frequency, determined at } \hat{\mathrm{B}} \leq 1 \text { gauss through the } \\ & \text { resulting } \mathrm{R} / \mathrm{L} \text { value for eddy current and residual loss }\end{aligned}$

$$
\frac{\mathrm{R}}{\mathrm{L}}=\frac{\tan \delta}{\mu_{i}} \times \mu_{e} \times 2 \pi \mathrm{f} \quad \Omega / \mathrm{H} \quad \text { (f in } \mathrm{c} / \mathrm{s} \text { ) }
$$

$\mathrm{q}_{2-24-100}$. . . . . constant for hysteresis losses standardized for an effective volume of $24 \mathrm{~cm}^{3}, \mu_{e}=100$ and measured between two currents, corresponding to two $\mathrm{B}_{\text {max }}$ values, stated in the ferroxcube catalogue.
At $800 \mathrm{c} / \mathrm{s}$, for a given volume $\mathrm{V}_{e}$, and for an equivalent permeability $\mu_{e}$, we obtain:

$$
\begin{aligned}
& \mathrm{q}_{2-\mathrm{V}-\mu}=\mathrm{q}_{2-24-100} \times\left(\frac{\mu_{e}}{100}\right)^{3 / 2} \times \sqrt{\frac{24}{\mathrm{~V}_{e}} \Omega / \mathrm{H}^{3 / 2} \mathrm{~mA}} \\
& \frac{\mathrm{R}_{h}}{\mathrm{~L}}=\mathrm{q}_{2-\mathrm{V}-\mu} \times \sqrt{\mathrm{L}} \times \mathrm{i} \times \frac{\mathrm{f}}{800} \Omega / \mathrm{H}
\end{aligned}
$$

( L in henry, f in $\mathrm{c} / \mathrm{s}$ and i in mA )
@ . . . . . . . . . specific resistance in $\Omega . \mathrm{cm}$ measured with d.c.

## FERROXCUBE 3 \& 4

## MAIN APPLICATIONS

Ferroxcube is the name given to the ceramic soft magnetic core material produced by our factories. Owing to its excellent properties, this material more and more supersedes metallic core materials. Thanks to the high electrical resistivity the eddy current losses in the material are extremely low, even at high frequencies, so the troublesome process of laminating the core can be avoided. Hence ferroxcube is supplied as ready-shaped piece parts the forms of which have been adapted to the required magnetic circuit.

## FERROXCUBE 3 \& 4

PIECE PARTS FOR ERASING HEADS (material grades 3C1 and 3C2)

For good erasing of magnetic tape at a low noise level, a frequency is required that is several times higher than the maximum frequency to be recorded. That is why, for use in erasing heads a core material with low eddy current losses is recommended. Low eddy current losses imply low heat dissipation, and consequently less power for the erasing procedure.
Ferroxcube cores possess this property in a much higher degree than laminated metal cores, so that they are plainly indicated for this application.
The tables below contain data of ferroxcube cores in the material grades 3C1 and 3C2.

## Properties

Low eddy current losses at frequencies up to $500 \mathrm{kc} / \mathrm{s}$.
The initial permeability is approximately 900 .
The saturation flux at $23^{\circ} \mathrm{C}$ is
of ferroxcube 3C1 approx. 3300 gauss,
of ferroxcube 3C2 approx. 3800 gauss.

## POTCORES OF THE P-SERIES

## Introduction

Ever since ferroxcube potcores were first introduced some fifteen years ago, they have proved to be among the best cores for inductors and transformers and have been used in ever-increasing quantities. Originally developed for carrier telephone equipment, potcores are nowadays also used successfully in loading coils, tuned circuits, chokes, and many other applications where highly reliable inductors are required.

One of the great advantages of ferroxcube potcores over the conventional powderiron or spiral cores is that it is possible to adapt their effective permeability to the specific requirements of the inductor for a certain application. In this way, high quality factors and high stability of inductance can be obtained with cores of small volume. This also results in a small volume of the whole equipment, the more so as no additional external shields are required. Metal parts in the vicinity of the coil do not cause losses, since the stray magnetic field around the potcores is extremely small.

A great variety of potcore types is available to suit the widest diversity of requirements in a frequency range extending from audio frequencies to approximately $20 \mathrm{Mc} / \mathrm{s}$.

Contrary to the custom of the early days of ferroxcube, when a type of core was designed for a specific application, to-day ranges of internationally standardized cores are available (see the tables), which can be used in the majority of applications. In this way, the creation of a great variety of core shapes is avoided, and all the advantages of largescale production, constant quality level and reasonable prices are fully exploited.

The entire problem of the construction of a coil or a transformer can be reduced to the following points. Around a core of magnetic material, a number of windings of conducting wire must be arranged in some way or other. This arrangement must be such that winding and core are not only kept together in a stable way, but also that the coil can be easily inserted into a circuit. A further requirement is that the assembly should preferably be suitable for conventionally wired circuits as well as for mounting on printed-wiring boards. Finally, coils for tuned circuits should be provided with means of adjusting their inductance, so that the circuit of which they form part can be tuned inductively, and bulky capacitive trimmers avoided.

Apart from the complete range of ferroxcube potcores, a comprehensive survey of coil formers, mounting parts and adjusting devices is given that eminently match the range of potcores.

## FERROXCUBE 3 \& 4

## POTCORES OF THE P-SERIES

## Electrical properties

On the following pages the values of relative effective permeability, $\mu_{e}$, are given. This characteristic is the most important factor to be considered when designing a coil with a ferromagnetic core. The relative effective permeability is defined as

$$
\mu_{e}=\frac{\sum \frac{1}{\mathrm{~A}}}{\sum \frac{1}{\mu_{i} \mathrm{~A}}}
$$

where $\mu_{i}=$ the relative initial permeability of the material used;
I = the length of the lines of force of the part of the magnetic circuit considered, in cm ;
$A=$ the cross-section through the core, perpendicular to the direction of the lines of force, in $\mathrm{cm}^{2}$.

For a certain required inductance $L$, the necessary number of turns $N$ is calculated either from

$$
\mathrm{N}=\alpha \sqrt{\mathrm{L}}
$$

or from

$$
\mathrm{N}^{2}=\frac{\mathrm{L}}{\mathrm{~A}_{L}},
$$

in which:
$\alpha=$ the turns factor, that is, the number of turns for 1 mH when the coil former is completely filled;
$\mathrm{A}_{L}=$ the inductance factor, that is, the inductance in nH per turn, also calculated for a completely filled coil former.

If no adjustment is carried out by introducing an air gap, the limits between which the inductance of the assembled coil may vary are determined by the guaranteed properties of the core material and the mechanical tolerances of the core.
The values of $\mu_{e}, \alpha$ or $\mathrm{A}_{L}$ mentioned are to be used for the potcores without the adjusting mechanism.
The most important electrical properties of a coil are the total losses at low induction, the hysteresis losses and the stability of
 the inductance with time and temperature. They are determined to a great extent by the proper choice of the effective permeability $\mu_{e}$. It should always be kept in mind, however, that in the case of the maximum quality factor, about one half of the total losses is still made up of losses in the copper and insulating material. When designing coils, it is, therefore, most important to select the right kind of winding wire and insulating material. For low-frequency coils the winding space should be used to the full extent, and for high-frequency coils care should be taken that the stray capacitance does not become excessive.
It is impossible to give here hard and fast rules for the optimum design of potcored coils. More detailed information will be gladly supplied on request.

## FERROXCUBE 3 \& 4

## POTCORES OF THE P-SERIES

## Grades of material

Potcores can be obtained in different grades of ferroxcube. Each grade has specific advantages in a certain frequency range and for certain applications. For example, grade 3 H 1 has been developed to match the temperature coefficient of polystyrene capacitors; grade 3B7 is meant for coils in combination with mica capacitors.

The table below indicates the purpose for which the different materials are most suitable. A survey of material properties that gives more detailed information can be found on page G7.
Not all potcore sizes are available in each of the material grades mentioned in the table. Since the choice of a certain core size depends on, amongst others, the frequency of the application concerned, a selection has been made for the most frequent requirements. Subsequent tables contain the grades of material in which the various types of core are normally available.

| main <br> application | approximate <br> frequency range | ferroxcube <br> grade |
| :--- | :---: | :---: |
| filter coils | from 0.1 to $200 \mathrm{kc} / \mathrm{s}$ | $3 \mathrm{~B} 7,3 \mathrm{H} 1$ |
|  | $200 \mathrm{kc} / \mathrm{s}$ to $2 \mathrm{Mc} / \mathrm{s}$ <br> $2 \mathrm{Mc} / \mathrm{s}$ to $20 \mathrm{Mc} / \mathrm{s}$ | 3 D 3 |
|  | up to $60 \mathrm{kc} / \mathrm{s}$ | 4 C 4 |
| loading coils, <br> transformers, <br> chokes$\quad 200 \mathrm{c} / \mathrm{s}$ to $10 \mathrm{Mc} / \mathrm{s}$ | 3 H 1 |  |

FERROXCUBE 3 \& 4

## POTCORES OF THE P-SERIES

## Available types

Potcores are generally supplied in three versions:
(a) potcore halves without air gap

These cores are of interest to large-quantity consumers who are doing their own adjustments, and who in this way are offered all the advantages of simple stock keeping and a free choice of the effective permeability.

Preferred types of potcore halves (P-series)

| material | 3 H 1 | $3 B 7$ | 3D3 | 4C4 |
| :---: | :---: | :---: | :---: | :---: |
| P 11/7 | K5 35216 | K5 35215 | K5 35217 | K5 35219 |
| P 14/8 | K5 35182 | K5 35181 | K5 35180 | K5 35184 |
| P 18/11 | K5 35152 | K5 35153 | K5 35151 | K5 35154 |
| P 22/13 | K5 35201 | K5 35200 | K5 35202 | K5 35203 |
| P 26/16 | K5 35157 | K5 35158 | K5 35156 | K5 35159 |
| P 30/19 | K5 35205 | K5 35206 | K5 35207 | K5 35209 |
| P 36/22 | K5 35161 | K5 35162 | K5 35163 | K5 35164 |
| P 42/29 | K5 35222 | K5 35221 | - | - |

Potcore halves are only supplied without an air gap.
Two parts are required for one complete core.
(b) pre-adjusted potcores with $\mu_{e} \cdot$ values following the E6 progression

The advantage of this range of pre-adjusted potcores is that for each potcore size the same effective permeability may be chosen. Narrow limits of inductance after assembly can be realised.
(c) pre-adjusted potcores with $\mathbf{A}_{L}$-values following the R5 and R10 progression

Like the pre-adjusted types mentioned under (b), these potcores have narrow inductance limits.

## Accessories and mounting parts

## Coil formers

The type numbers of the standard (I.E.C) coil formers are given with their nominal dimensions. The rigid insulating material can amply withstand the stresses that occur during winding. It has an adequate moisture resistance, and
 will endure the conventional impregnating temperatures.

## Adjustors

The inductance of a pre-adjusted potcore can be increased by inserting an adjustor. In practice, an adjustment range of $10 \%$ is generally sufficient to cope with the tolerances of capacitors and inductors, and with the parasitic capacitances and inductances that occur when components are incorporated in a circuit.
On pages G34-G38 for each type of potcore the corresponding type of adjustor is given which will increase the published $\mu_{e}$-value by a minimum of $8 \%$, and a maximum of $14 \%$ approximately.
When optimum stability is of prime importance, the type of adjustor that matches a certain potcore should be chosen. If it is desired to widen the adjustment range, however, an adjustor indicated for a potcore with a high $\mu_{e}$-value may be used in a potcore with a low $\mu_{e}$-value.

## Mounting parts

Potcored coils can be mounted on conventional panels (see below), as well as on printed-wiring boards; the location of the soldering tags being matched to the 0.1 in . as well as to the 2.50 mm grid. The insulating material of the tag plate can fully withstand the temperatures occurring during dip-soldering.
After placing the spring in the container, the core is brought under the correct pressure by pressing the tag plate down to the rim of the container. It will be held in place after the three ears have been folded over. For conventional panel mounting, a fixing bush and nut are separately available. Type $P$ 11/7 does not possess this mounting facility.
Further information on the design of simple tools for potcore assembly will be gladly supplied on request.

## FERROXCUBE 3 \& 4

## CONTINUOUS INDUCTANCE ADJUSTORS OF POTCORES P11/7

The tolerances on inductance of the pre-adjusted potcores (without adjustor) are given on the pages G38-G45. After inserting a coil (impregnated or not) in an electrical circuit, its inductance can be adjusted to the required value with an accuracy $<0.3^{\%} / 00$ by means of a continuous inductance adjustor. Such an adjustor increases the inductance of the coil by maximum 8 to $14 \%$.
The adjustor is screwed in the centre hole of the potcore by means of a matching nut and is held in position by the corner edges on the top of the adjustor.
For special requirements a bigger or smaller adjustment range may be obtained by using an adjustor belonging to the next higher or lower effective permeability. The influence of these adjustors on the variability of the inductance is negligible.
The maximum permissible temperature is $110^{\circ} \mathrm{C}$.
Recommended adjustors for the pre-adjusted potcores are given below.

## Adjustor

## POTCORES OF THE P-SERIES-P11/7

Pre-adjusted potcores of the $\mu_{\mathrm{e}}$ range
Preferred types

| $\mu_{e}$ | $\alpha_{m H}$ | tolerance on inductance (\%) | potcores assembly number ${ }^{1}$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | ferroxcube grade |  |  |  |
|  |  |  | 3B7 | 3H1 | 3D3 | $4 \mathrm{C4}$ |
| 15 | 225 | $\pm 1$ |  |  |  | K3 00317 |
| 22 | 186 | $\pm 1$ |  |  |  | 318 |
| 33 | 152 | $\pm 1$ |  |  | K3 00311 | 319 |
| 47 | 127 | $\pm 1$ |  |  | 312 |  |
| 68 | 105.8 | $\pm 1$ | K3 00291 | K3 00301 | 313 |  |
| 100 | 87.2 | $\pm 1.5$ | 292 | 302 |  |  |
| 150 | 71.2 | $\pm 2$ | 293 | 303 |  |  |
| 660 | 33.9 | $\pm 25$ |  |  | 310 |  |
| 1300 | 24.2 | $\pm 25$ | 290 | 300 |  |  |

Number of turns for $\mathrm{L} m H$ is $N=\alpha \sqrt{L}$
The inductance will only be within the guaranteed limits if the winding space of the coil former is completely filled with the number of turns determining the desired inductance.

Approximate weight

$$
1.8 \text { grams }
$$

Mean length of lines of force $\quad \mathrm{I}_{\mathrm{e}}=1.55 \mathrm{~cm}$

Effective volume

$$
\begin{aligned}
\Sigma \frac{1}{\mathrm{~A}} & =9.56 \mathrm{~cm}^{-1} \\
\mathrm{~V}_{\mathrm{e}} & =0.251 \mathrm{~cm}^{3}
\end{aligned}
$$

## Non-preferred types

| $A_{L}$ | corresponding $\mu$-value | tolerance on inductance (\%) | potcore assembly number ${ }^{1}$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Ferroxcube grade |  |  |  |
|  |  |  | $3 \mathrm{B7}$ | 3 H 1 | 3D3 | $4 \mathrm{C4}$ |
| 25 | 19.0 | $\pm 1$ |  |  |  | K3 00638 |

| minimum window area in $\mathrm{mm}^{2}$ | 394 |
| mean length of turn in cm | 15 |
| approximate weight in grams | 13 |
| maximum temperature in ${ }^{\circ} \mathrm{C}$ | 130 |

The coil former is according to German specification D.I.N. 41304; it is delivered in parts.

## FERROXCUBE 3 \& 4

## FERROXCUBE CROSS CORES - X22

These cores have been developed especially for transformers to be mounted on printed-wiring boards.
Two versions of core halves can be supplied:
(1) without an air gap, and
(2) with air gap. Standardised air gap lengths in each core half are:
$0.02,0.05,0.15$ and 0.25 mm .
The material grades are ferroxcube $3 \mathrm{H} 1,3 \mathrm{E} 1$ and 4 C 4 .
When ordering, the desired core half should be indicated by its type number.
The numbers for separate core halves are:
$\begin{array}{llll}\text { K5 } & 35190 & \text { for fxc } & \text { 3E1 } \\ \text { K5 } & 351 & 92 & \text { for fxe } \\ \text { K } & 3 H 1 \\ \text { K } & 351 & 93 & \text { for fxe }\end{array}$
They are supplied without air gap.
For the combination of two cross-core halves, chosen at random from a lot, the following properties are guaranteed at $25 \pm 10^{\circ} \mathrm{C}$.

|  | $\hat{B}$ <br> (gauss) | frequency <br> $(\mathrm{kc} / \mathrm{s})$ | K5 35190 |  |  |  | K5 35192 | K5 351 93 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mu_{\mathrm{e}}$ | $\leq 1$ | 4 | $\geq 1490$ | $\geq 1440$ | $\geq 98$ |  |  |  |
| $\alpha$ | $\leq 1$ | 4 | $\leq 17.5$ | $\leq 17.8$ | $\leq 68.0$ |  |  |  |
| $\tan \delta$ | $\leq 1$ | 4 |  | $\leq 1.2 \times 10^{-6}$ |  |  |  |  |
| $\mu_{\mathrm{i}}$ | $\leq 1$ | 100 |  | $\leq 5 \times 10^{-6}$ |  |  |  |  |
|  | $\leq 1$ | 2000 |  |  | $\leq 40 \times 10^{-6}$ |  |  |  |
|  | $\leq 1$ | 5000 |  |  | $\leq 60 \times 10^{-6}$ |  |  |  |
| $q_{2-24-100}$ | $\leq 1$ | 10,000 |  |  |  |  |  |  |

The mechanical pressure at which above mentioned values are determined is 12 kg .

## FERROXCUBE 3 \& 4

## FERROXCUBE CROSS CORES - X22

The following $X$-core halves are available with an air gap:

| type number |  | material |
| :---: | :---: | :---: |
| K5 35253 | air gap length in mm |  |
| K5 352 50 | 3 H 1 | $0.02 \pm 0.01$ |
| K5 352 51 | 3H1 | $0.05 \pm 0.015$ |
| K5 352 52 | 3H1 | $0.15 \pm 0.015$ |

Approximate weight of two halves
Mean length of lines of force
effective volume

$$
\begin{aligned}
& 12 \mathrm{grams} \\
\mathrm{I}_{\mathrm{e}} & =3.80 \mathrm{~cm}^{2} \\

## FERROXCUBE 3 \& 4

## FERROXCUBE CROSS CORES - X30

These cores have been developed especially for transformers to be mounted on printed-wiring boards. Two versions of core halves can be supplied:

1) without air gap
2) with air gap

Standardized air gap lengths in each core half are: $0.02,0.05,0.15$ and 0.25 mm . The material grade is fxc 3 H 1
When ordering, the desired core half should be indicated by its type number. The type number for the separate core half without air gap is:

K5 35255 for fxc 3 H 1
For the combination of two cross-core halves, chosen at random from a lot, the fo!lowing properties are guaranteed at $25 \pm 10^{\circ} \mathrm{C}$.

|  | $\hat{B}$ <br> (gauss) | frequency <br> $(\mathrm{kc} / \mathrm{s})$ | type number <br> $\mu_{\mathrm{e}}$ |
| :---: | :---: | :---: | :---: |
| $\alpha$ | 4 | K5 352 55 |  |
| $\frac{\tan \delta}{\mu_{\mathrm{i}}}$ | $\leq 1$ | 4 | $\geq 1525$ |
| $\mathrm{q}_{2-24-100}$ | $\leq 1$ | 4 | $\leq 15.9$ |

The mechanical pressure at which above mentioned values are determined is 25 kg .

The following X -core halves are available with an air gap:

| type number | material | air gap length in mm |
| :--- | :---: | :---: |
| K5 352 65 | 3H1 | $0.02 \pm 0.01$ |
| K5 352 66 | 3 H 1 | $0.05 \pm 0.015$ |
| K5 352 67 | 3H1 | $0.15 \pm 0.015$ |
| K5 352 68 | 3H1 | $0.25 \pm 0.015$ |

Approximate weight of two halves
Mean length of lines of force
effective volume

$$
\begin{aligned}
& 38 \text { grams } \\
\mathrm{I}_{\mathrm{e}} & =5.58 \mathrm{~cm}_{\mathrm{e}} \\
\mathrm{~A}_{\mathrm{e}} & =1.14 \mathrm{~cm}^{2} \\
\Sigma \frac{\mathrm{I}}{\mathrm{~A}} & =4.90 \mathrm{~cm}^{-1} \\
\mathrm{~V}_{\mathrm{e}} & =6.36 \mathrm{~cm}^{3}
\end{aligned}
$$

This X -core meets the following specifications:
International: I.E.C.
France : C.C.T.U. O6-10
Germany : D.I.N. 41299

## COIL FORMER - X30

## FERROXCUBE 3 \& 4

## FERROXCUBE CROSS CORES - X35

These cores have been developed especially for transformers to be mounted on printedwiring boards. Two versions of core halves can be supplied:

1) without air gap
2) with air gap

Standardized air gap lengths in each core half are: $0.02,0.05,0.15$ and 0.25 mm .
The material grade is fxc 3 H 1
When ordering, the desired core half should be indicated by its type number.
The type number for the separate core half without air gap is:

$$
\text { K5 } 35260 \text { for } \mathrm{fxc} 3 \mathrm{H} 1
$$

For the combination of two cross-core halves, chosen at random from a lot, the following properties are guaranteed.

|  | $\hat{B}$ <br> (gauss) | frequency <br> $($ (kc/s) | type number |
| :---: | :---: | :---: | :--- |
|  | $\leq 1$ | 4 | K5 35260 |
| $\mu_{\mathrm{e}}$ | $\leq 1$ | 4 | $\leq 14.4$ |
| $\alpha$ | $\leq 1$ | 4 | $\leq 1.2 \times 10^{-6}$ |
| $\frac{\tan \delta}{\mu_{\mathrm{i}}}$ | $\leq 1$ | 100 | $\leq 7 \times 10^{-6}$ |
| $\mathrm{q}_{2-2 \ell-100}$ | $15-30$ | 4 | $\leq 1.8$ |

The mechanical pressure at which above mentioned values are determined is 33 kg .

The following $X$-core halves are available with an airgap:

|  |  | type number | material | air gap length in mm |
| :---: | :---: | :---: | :---: | :---: |
|  |  | K5 35270 | 3 H 1 | $0.02 \pm 0.01$ |

## POTCORES OF THE D-SERIES

Still available, details on request

H-SERIES FOR MINIATURIZED TRANSFORMERS - MATERIAL GRADE $3 E 2$

According to the construction, two kinds of transformer should be distinguished:
those whose coils are wound around the core, and those where separately wound coils are applied to the core.

Toroidal transformers and items made of two-hole beads belong to the first kind, and $E$ and $U$ cores are used for the second one.
A toroid is the most simple form of a coil, and the absence of an air gap allows the full profit of the permeability. In the second case, well-defined windings can be made even automatically, and the wire leads can be directly connected to tags on the coil former.
When ferrites came into use, at first the existing core shapes were taken over, but soon round legs were introduced. Later on, also potcores were used for transformers. The printed-wiring technique led to arranging every component in a rectangular space. To utilize that space to the full, transformers should be designed so as to fill the entire space with core material, copper, insulating material and mounting parts, and this brought us to FXC cross and butterfly cores.

Fig. 1

Fig. 2

## H-SERIES FOR MINIATURIZED TRANSFORMERS - MATERIAL GRADE 3E2

## Technical data

The overall dimensions and the pattern of connections of the three core types indicated above are shown in Figs 3, 4 and 5.

Fig. 3

Fig. 4

Fig. 5

The dimensions are valid for the cores assembled with the screening cans. If the requirements for the cross talk attenuation are moderate or low the cores may be used without screen.

Information for the calculation of transformers as well as typical examples of applications are supplied on request.

## Assembly

As mentioned above, the number of component parts has been reduced to the bare minimum. With two parts in all a complete transformer can be produced ready for mounting on a printed circuit. The screening can (Fig. 8) for meeting severe cross talk requirements adds up to three parts:

1. fxc 3 E 2 H -shaped part moulded in a coil former with terminals
2. fxc $3 E 2$ rectangular window for the H 7 and H 10 core (Fig. 1 and 6 ) or a U-shaped part for the H 20 core (Fig. 2 and 7)
3. brass screening can

When the winding space has been used completely, it is advised to apply an insulating washer in the screen.

Fig. 6

Fig. 7

## FERROXCUBE 3 \& 4

## H-SERIES FOR MINIATURIZED TRANSFORMERS - MATERIAL GRADE 3E2

The assembly operation is very simple indeed:

1. wind the copper wire on the H part. For speeding up the soldering operation of the winding wire to the terminals, the use of self fluxing wire is advised. In case a terminal of the winding must be connected to the screening can it should be soldered to tag 1. The side of the coil former where the soldering tags protrude is asymmetrical providing a means for numbering the connections (see Fig. 6 and 7);
2. take care that the joining surfaces of the two core parts are clean and free from dust;
3. place the 0 part respectively $U$ part on top of the H under slight pressure;
4. apply a suitable adhesive in the four corners of the H 7 and H 10 core near the contact surface of H and O , for the $\mathrm{H}-\mathrm{U}$ construction apply the adhesive around the joint of the assembled H and U . Remove the pressure after the curing of the adhesive.
The spots where the adhesive is to be applied should be degreased thoroughly.
As a suitable adhesive for instance Araldite, type D with harder type HY 951 may be used (1 part harder to 12.5 parts Araldite D).

The curing time should not be less than 15 hours at room temperature. This time may be shortened at higher temperatures. Reference should be made to the instructions issued by the manufacturers of adhesives.
5. in case a can is used (for H 10 see Fig. 8) place the core assembly in the can in such a way that the marked pin 1 is situated over the hole H in the bottom of the can (Figs. 6 and 7). When the screen must be connected to earth fold-over the four ears and solder the longest ear to pin 1 . When the screen must not be connected to

Fig. 8

Fig. 9

Fig. 10
earth before folding over, cut off approximately 1 mm from the longest ear.
When the screening can is properly placed on the assembled core, terminal 1 is located near hole H in the can (see Figs. 6 and 7); this facilitates the correct positioning of the transformer during assembling the equipment in which the transformer is used.
The coil former material withstands the usual dipsoldering temperatures.

## FERROXCUBE TOROIDS

Advantages of toroids over other shapes are:
a. small magnetic stray fie!d,
b. high $\mu$-values.

They are very attractive for those applications in which small dimensions are required, such as broadband transformers and pulse transformers.

The toroids are barrel-finished and covered with an insulating lacquer.
Table 1: Dimensional quantities, tolerances and weights.
$\left.\begin{array}{c|c|c|c|c|c|c}\hline D & d & h & l_{\mathrm{e}} & \sum \frac{I}{\mathrm{~A}}\end{array}\right)$

Note: All dimensions apply to the not lacquered version.
Different series are available:
Series A: Ferroxcube grade 3E1
$\mu_{\text {tor }}=2700 \pm 20 \%$
green lacquered

Series B: Ferroxcube grade 3H1 Sorted into $\mu$ groups Orange lacquered

| dimensions $(\mathrm{mm})$ | type number |
| :--- | :---: |

| 9 | $3720-4110$ | white | 44.2 | 39.7 | 32.5 | 24.1 | 19.2 |
| 10 | $>4050$ | black | 43.3 | 38.9 | 31.8 | 23.7 | 18.8 |

Number of turns for $L_{m H}: N=\alpha \sqrt{L}$
The $\mu$ groups are determined with the nomina! $\Sigma \frac{\mathrm{I}}{\mathrm{A}}$ values (see table I)
The $\alpha$ factors of the groups 1-9 are average values, those of group 10 are maximum values.
D.F. at $23 \pm 1^{\circ} \mathrm{C} \leq 4.3 \times 10^{-6}$

Between +23 and $+70^{\circ} \mathrm{C}$ the min. $\mu_{\text {tor }}$ of the product is greater than the min. $\mu_{\text {tor }}$ of the group.
The sorting into $\mu$ groups is done merely for the convenience of the user. The toroids are not available per separate group.

Series C: Ferroxcube grade 3E2
$\mu_{\text {tor }}>5000$
blue lacquered

| dimensions $(\mathrm{mm})$ | type number |
| :---: | :---: |
| $4 \times 2.2 \times 1.1$ | 2 P 65329 |
| $6 \times 4 \times 2$ | 2 C 65330 |
| $9 \times 6 \times 3$ | 2 P 65331 |
| $14 \times 9 \times 5$ | 2 P 65333 |
| $23 \times 14 \times 7$ | 2 P 65334 |

Series D: Ferroxcube grade 4C4
$\mu_{\text {tor }}>100$
red lacquered

| dimensions (mm) | type number |
| :---: | :---: |
| $6 \times 4 \times 2$ | 2P 65346 |
| $9 \times 6 \times 3$ | 2P 65347 |
| $14 \times 9 \times 5$ | 2P 65348 |
| $23 \times 14 \times 7$ | 2P 65349 |
| $36 \times 23 \times 15$ | 2P653 50 |

Note: It should be noticed that the properties of a toroid will deviate more from the material properties in proportion as its dimensions are smaller.
A straight-forward translation of the material figures is therefore not always possible.

## FERROXCUBE 6 (square loop)

## MAGNETIC MEMORY CORES

Aii data-handling systems employ some sort of device for the storage of information. Such a "memory" can accept, store and supply the information at any required moment. For this purpose a magnetic core memory is very often used.

The storage capacity of a magnetic core is the result of its property to assume either of two stable magnetic states. One magnetic state is maintained, until it is made to change into the other.
The main features which can be distinguished are as follows:

1. read/write cycle time of only a few microseconds;
2. random access;
3. the information can be stored for an indefinite period;
4. storage of large quantities of information in a small volume.

The properties of the cores described below are such that the cores are specially suitable for use in coincident current memories.
We draw your attention to the low temperature coefficient (LTC) cores, the electrical properties of which remain substantially constant over the entire range of operating temperatures.

## CORE TYPES

$$
\begin{aligned}
& 150 \mathrm{mil}-6 E 1 \\
& 80 \mathrm{mil}-6 \mathrm{~B} 2 \\

& 30 \mathrm{mil}-6 \mathrm{~F} 2,6 \mathrm{~F} 3,6 \mathrm{~F} 4
\end{aligned}
$$

For more information see section B "Electronic building bricks for professional applications".

## ULTRASONIC TRANSDUCER - MATERIAL GRADE 7 A2

Ultrasonics are more and more applied by all kinds of industries for cleaning and degreasing purposes. Notably watch makers, instrument makers, electron-tube manufacturers, and manufacturers and users of other small components that have intricate shapes or are difficult of access (e.g. hypodermic needles) consider ultrasonic cleaning to be superior to conventional methods. Recent tests showed that, whereas other methods resulted in removal of some 30 to $80 \%$ of the adhering dirt, ultrasonic cleaning removed up to $100 \%$ of the contamination. Larger machined parts may also be cleaned in this way, e.g. polished lenses and ball bearings, ground ceramic components, etc. In the iron industry ultrasonics can be used for de-rusting steel plates. Other ultra-sound applications are underwater detection (Sonar or Asdic, fishing aids), drilling, welding, destroying of cell membranes or bacteria, etc.
The ultrasonic vibrations are generated by the conversion of H.F. current through electroacoustic transducers. Usually the transducers consist of either piezoelectric or piezomagnetic materials. For piezomagnetic transducers a new grade of ferroxcube has been developed, namely 7A2.
Ferroxcube 7A2 tranducers are best suited for applications in which the temperature is not controlled. This is the case with many modern types of efficient cleaning equipment where the transducers are cemented outside a liquid-filled vessel.
The solid ferroxcube transducers excel by a very high electroacoustic efficiency. If properly mounted they may yield a value of 70 to $85 \%$, whereas the efficiency of laminated metallic piezomagnetic transducers usually does not exceed $35 \%$. This means that for a given acoustic output a smaller, simpler and consequently cheaper electric generator can be used and that the power consumption can be reduced by more than $50 \%$.
The table on page G74 shows the nominal operating frequencies and the physical dimensions of a number of current types of ferroxcube transducers, those on pages G72 and G73 give the main electrical and acoustical properties.

## PERMANENT MAGNETIC CERAMIC MATERIALS

## FERROXDURE

## Demagnetizing curves

N.B. The min. $\mathrm{H}_{\mathrm{s}}$ curve for ferroxdure 250 K coincides with the min. $\mathrm{B}_{\mathrm{r}}$ curve for ferroxdure 300R.

## PERMANENT MAGNETIC CERAMIC MATERIALS

## FERROXDURE

## Electrical and mechanical characteristics

The mechanical properties of ferroxdure are similar to those of other ceramic material. Ferroxdure is hard and brittle and can only be machined by grinding with suitable discs of silicon or of diamond. During grinding care must be taken to ensure that cooling is sufficient, to avoid cracks by local overheating.

Being a ceramic material ferroxdure is chemically rather inert. Its chemical resistance is characterised as follows:

Ferroxdure is not affected by:
sodium chloride in a $30 \%$ solution;
a mixture of benzol-trichlorine ethylene in a $50 \%$ solution;
petrol;
nitric acid;
nitric acid in a $50 \%$ solution;
acetic acid;
cresol;
phenolic solutions;
sodium sulphate solution;
Ferroxdure is hardly affected by:
delute sulphuric acid;
hydrochloric acid in a $50 \%$ solution;

Ferroxdure is rather strongly affected by:
concentrated hydrochloric acid.

## PERMANENT MAGNETIC CERAMIC MATERIALS

## FERROXDURE 330K, 360R

Type FXD330K has resemblance to type FXD250K, it has a higher induction and an appreciably higher maximum energy product $\mathrm{BH}_{\text {max }}$. The higher coercivity results in greater resistance to demagnetization.
In the majority of cases, it will be possible to insert the magnets magnetized. Furthermore, calculations can be based on the maximum energy product and so, designs having a minimum magnet volume can be obtained.

Type FXD360R has resemblance to type FXD300R has the same induction, but higher coercivity and a higher maximum energy product $\mathrm{BH}_{\text {max }}$.
The low-temperature stability is improved proportionately and, if no considerable variations in temperature occur, a higher energy product (a wider angle of the load line) can be employed.
The results will be:

- A reduced magnet volume for a given specification.

## Application

No doubt, the advantages of the crystal-oriented material FXD330K will further stimulate the use of sandwich-type of sticking systems such as magnetic chucks. More in particular, however, it will be of importance for professional applications such as travelling-wave tubes, electronic watches, magnetos, alternators, generators, DC motors, clutches, filters, separators.
As a consequence of the superior reversibility, in many cases it will be possible to obtain - apart from simplified constructions - higher air-gap inductions (up to $30 \%$ higher values were observed). This will occur, for instance, when flat magnets - such as e.g. used for biasing magnetostrictive transducers of FXC7A - are mounted magnetized.
If these raised values are not required or cannot be effectuated - on account of e.g. saturated pole shoes - the cross section of the magnet may be reduced proportionately, thus leading to smaller and cheaper systems.
To obtain a homogeneous field in permanent-magnetic D.C. motors use is made of diametrically oriented rings, or diametrically or radially oriented segments. Apart from going a high flux, FXD330K allows the insertion of magnetized magnets as a consequence of the improved reversibility.
If magnets of FXD360R are magnetized in their system and if dismounting requirements are not imposed, a somewhat higher flux can be obtained than in the case of FXD330K.
For static applications in systems having a narrow air gap, FXD360R permits shorter magnets than FXD300R to obtain a given induction in the gap, if the other dimensions remain unchanged. Therefore, for a given specification, the use of FXD360R results in flatter magnet systems; this is of importance in the case a small system height is requested.

The temperature coefficient of induction and coercivity is the same for the new versions as for the older ones, but the load line may make a larger angle with the B -axis without the occurrence of magnetic losses after a transient cooling down.

## PERMANENT MAGNETIC CERAMIC MATERIALS

FERROXDURE

## Preferred type list

The preferred type list comprises the shapes and sizes of permanent magnets for which we already possess the dies or the moulding plates. We shall be glad to offer any other shape or size required within the technical possibilities.

## PERMANENT MAGNETIC MATERIALS

## PLASTIC-BONDED FERROXDURE

Recent developments in the field of permanent magnetic materials have led not only to improvements in the magnetic properties of existing grades, but also to the manufacturing of plastic-bonded magnets. These are made by mixing ferroxdure powder either with thermoplastic or with thermosetting materials and shaping them by one of the familiar plastic manufacturing techniques, such as extrusion - injection moulding - pressing.

These new permanent magnetic materials, introduced as plastic-bonded ferroxdure, combine the characteristic magnetic properties of isotropic ferroxdure (albeit at a lower level) with the mechanical properties of the plastic materials used.

This opens the possibilities to obtain for example:

- flexible magnets, which can easily be cut, e.g. with a knife or scissors;
- magnets having close geometrical tolerances without need of machining them;
- magnets having intricate shapes;
- magnets which can easily be machined with normal tools;
- inexpensive magnets.

These features, combined with the low price of the materials used, offer the possibility of obtaining inexpensive magnets. They offer the opportunity to use magnets in those cases where this was impracticable in the past, either for technical or for price reasons; they may provide a cheaper solution in magnet applications already existing.
We can now offer the following three plastic-bonded ferroxdure permanent magnetic materials:
Ferroxdure P30 (Norm KPN-K-992) A soft, flexible and resilient material with $85 \mathrm{wt} \%$ ferroxdure powder (M) $\mathrm{Fe}_{12} \mathrm{O}_{19}$ and $15 \mathrm{wt} \%$ thermoplastic material, shaped by extrusion or injection moulding.
Ferroxdure P40 (Norm KPN-K-989) A flexible material with 90 wt \% ferroxdure powder (M) $\mathrm{Fe}_{12} \mathrm{O}_{19}$ and $10 \mathrm{wt} \%$ thermoplastic material, shaped by extrusion or injection moulding in bars, strips, rods, and suchlike.
Ferroxdure D55 (Norm KPN-V-815) A hard and rigid material with $95 \mathrm{wt} \%$ ferroxdure powder (M) $\mathrm{Fe}_{12} \mathrm{O}_{19}$ and $5 \mathrm{wt} \%$ thermosetting material, shaped by pressing. This material is magnetically superior to the flexible materials; moreover, close tolerances can be achieved without machining.

## PERMANENT MAGNETIC CAST ALLOY

## ANISOTROPIC ,,TICONAL"

Demagnetizing curves

"Ticonal" grades are anisotropic alloys of special composition with high magnetic values in a preferred direction.
The method of production of the grades $360,400,500$ and 600 is similar. Compared with these types, grade 750 has a high degree of crystal orientation, resulting in a high energy product.
The energy product for type 650 is somewhat lower than for the 750 , but it exceeds the values of the older types. Particulars regarding the types 650 and 750 can be found on page H 26 .
For characteristics see also page H 6 .

## PERMANENT MAGNETIC CAST ALLOY

## MAGNETIC MATERIAL TICONAL GRADE 900

This magnetic material has been known for some years under the name of "TICONAL XX". In the meantime the material has been used in practice for some purposes and it is now produced in quantities under the name of "TICONAL 900".
The figure shows the average demagnetizing curve of the material together with upper- and lowerlimit curves.
Owing to the great coercive force of "TICONAL 900", the cptimum length of the magnet will usually be very small. "TICONAL 900 " can often be used with success in those cases where recourse had to be had to platinum-cobalt. It was therefore decided to discontinue the manufacturing of platinum cobalt.
The magnets are cube-shaped. For this reason the magnetic circuit should be designed accordingly.
"TICONAL 900" is economically only attractive for tiny magnets.
Note: In the near future the minimum garanteed values will be equal to the average values given in the graph.

## PERMANENT MAGNETIC CAST ALLOY

## ANISOTROPIC "TICONAL" - NEW MATERIALS <br> "Ticonal" 750

The optimum magnetic performance is attended with a circular cross section. Therefore, and to avoid expensive tooling-up, we standardized the following diameters:

$$
10 \mathrm{~mm}, 12 \mathrm{~mm},\left(1 / 2^{\prime \prime}\right), 14 \mathrm{~mm},\left(5 / 8^{\prime \prime}\right), 18 \mathrm{~mm} .
$$

The magnet length should be calculated according to the circuit to be used and the performance required.

We have to draw your attention to the fact that, in comparison with the older grades, the high energy product of "Ticonal" 750 is the result of a high degree of crystal orientation. The consequence is a typical demagnetization curve having a sharp knee just at the values $\mathrm{B}_{\mathrm{d}}$ and $\mathrm{H}_{\mathrm{d}}\left(\mathrm{BH}_{\text {max }}\right)$.

Therefore, the working line of a statically used magnetic circuit - without an external demagnetizing field - should intersect the BH curve in the $\mathrm{BH}_{\max }$ point, or the results will be disappointing. That means, the use of "Ticonal" 750 would not lead to a higher performance or to a smaller magnet system than obtainable with e.g. "Ticonal" 600 or even "Ticonal" 500.

The material is also suitable for dynamic application incurring external demagnetizing fields.

## "Ticonal" 650

"Ticonal" 650 is another interesting new crystal-oriented permanent-magnet material available on commercially attractive delivery terms. It may be used when, for some reason, the magnet for any of the above mentioned applications cannot be made from the outstanding grade "Ticonal" 750 .

The energy product guaranteed for " 650 " is somewhat lower than for " 750 " but it exceeds the minimum value for the next best grade, "Ticonal" 600 , by $12 \%$ and that for "Ticonal" 500 by even $36 \%$.

Grade 650 has the essential advantage, that, compared with grade 750 , it is not subject to the restriction of a cylindrical shape. Nevertheless, holes should be avoided as well, because holes degrade the magnetic values as a result of disturbing the crystal orientation.

The nature of the material is such that the orientation should be straight and parallel to the axis of magnetization. Apart from cylinders, possible shapes are square bars and prismatic forms, which may have ground pole faces.

To ensure complete crystal orientation and optimum magnetic values, a geometric ratio length/diameter not in excess of 1 is recommended if the diameter does not exceed 15 mm .

For the rest, our statements on "Ticonal" 750 also apply to " $\$ 50$ ". The knee in the demagnetization curve is less sharp.
For further data see page H 6 .

## PERMANENT MAGNETIC CAST ALLOY

## RECO (ISOTROPIC)

## Demagnetizing curves

Reco is a permanent isotropic magnetic cast alloy, the various types are distinguished by the different percentage of cobalt and titanium. The types 170 and 220 are characterized by their high coercivity.

Other Materials

When considering the application possibilities for Peltier cooling, it should be kept in mind that all these cooling applications in principle can also be solved with compressors (together with additional provisions). Peltier cooling is preferable only in those cases where it offers definite technical or economical advantages. These may be e.g. the following ones:
a. relatively low cooling capacity required, so that a standard compressor device is overdimensioned, and Peltier offers a cheaper solution.
b. necessity for temperature constancy or temperature regulation, which with Peltier is much easier, cheaper and exacter than with compressors.
c. smaller volume
d. noiselessness
e. no supervision required

In the following, a number of such application examples is given.

## Measuring apparatus

1. Melting point determination ( -20 to $+80^{\circ} \mathrm{C}$ ). Here Peltier can act both as cooling and as heating medium. It easily permits melting point determinations down to lower temperatures, and moreover an easy and exact regulation. The melting can be either visually observed or found by a sudden change in a physical property e.g. the permittivity or the electrical resistivity.
2. Determination of freezing point depression. This is a customary method for the determination of molecular weight. Here Peltier cooling allows a higher precision, omission of the cooling bath and the possibility to repeat the freezing point determination several times without appreciable time loss.
3. Solidifying point and cloud point. This is particularly important for mineral and edible oils. Peltier allows a simpler cooling and a higher precision.
4. Dew point determination. By means of alternative Peltier cooling and heating, piloted by condensation of moisture upon a small mirror, a very quick and rapid determination of the dew point is possible, suitable for repeated moisture content measurements of gases, automatic moisture control, etc.
5. Zero grade standard. This can be easily and exactly realized by alternative Peltier cooling and heating in a small vessel of water. The Peltier battery can be piloted by using the sudden change in resistivity between water and ice. This zero grade standard can be used as reference temperature for the cold joint of thermocouples.
6. Flash point. This important property for mineral oils and fuels can be simply and accurately determined within a large temperature range by means of Peltier cooling, which above room temperature is commuted to Peltier heating. Any desired temperature-time curve can be realized in this way.
7. Cold resistance of oils. No bath cooling required; moreover better regulation and exactress.
8. Viscosity measurements at low temperature.

## Material separation

9. Ice zone melting, for purification and separation of organic chemical substances in heterogeneous phase (solid-liquid). By means of Peltier devices, a low temperature ( $-20^{\circ} \mathrm{C}$ ) can be reached, and easy regulation of temperature is possible. Moreover, heat and cold can be supplied at the same time, and the zone width adjusted.
10. Column crystallization. This is more or less the same procedure as ice zone melting, but on a continuous and industrial scale. For the use of Peltier, the same advantages apply.

## PELTIER BATTERIES

## APPLICATIONS (continued)

11. Thermodiffusion. This is a procedure for purification and separation of organic substances (e.g. proteins) in homogeneous liquid phase. When using Peltier, the required temperature can be adjusted easily, and exactly, the usable temperature range is extended towards the low temperature side, and heat and cold are supplied at the same time.
12. Gas chromatography, a separation method via the gas phase. The quantity of adsorbed matter can be increased by cooling the adsorbens. When this absorbens is afterwards heated by inverting the Peltier current, the adsorbed matter can be quickly driven out again. In this way, the sensitivity of the procedure can be increased and the required time shortened.

## General laboratory technique

1. Small thermostat $\left(-20+80^{\circ} \mathrm{C}\right)$. By means of Peltier, a smaller and cheaper thermostat can be constructed for the indicated temperature range, which can e.g. serve for circulation cooling with organic chemical reactions or with dialysis processes.
2. Drying by freezing. With Peltier cooling, a small and handy device can be constructed for drying small quantities of liquid by freezing out the last moisture remains. This is a well-known technique in biological, biochemical and medical fields.
3. Cooling of suction filters, e.g. for recrystallizing. Again, with Peltier a small and easily adjustable device can be constructed, which can either heat or cool a suction filter in a short time.
4. Test tube cooler, for chemical or biological work. Peltier enables a small and handy device, easily adjustable and without need for supervision.

## Miscellaneous

1. Keeping baths at constant temperature, e.g. for etching or staining purposes. Peltier allows a quick and exact adjustment.
2. Portable cooling box, for transport of temperature sensitive materials (blood plasma, vaccins, sperma).
3. Ultracentrifuge, where Peltier allows a quick and exact rotor cooling.
4. Automatic glass cutting. When glass is cut off by cracking, local Peltier cooling enables a very good and reproducible location of the crack, suitable for mass production.

## Remarks

For all applications mentioned above the standard batteries PT 20/20, or PT $48 / 6$ can be used. For some of them one battery will be sufficient, for others, e.g. the separation of different substances. the required cooling capacity can only be realized by using more batteries.

## PELTIER BATTERIES

HIGH CURRENT TYPE PT 20/20

Dimensional drawing of Peltier battery PT 20/20. The length of the terminals without mounting tags is 240 mm .

## characteristic data

Optimum working current: 20 A (water cooling of hot side required)
Voltage at optimum working current: approx. 2 V
Insulation resistance between plate surfaces and connecting cables: $>100 \mathrm{k} \Omega$
The given diagrams of cooling capacity and current versus temperature difference were measured for hot-side temperatures of 20 and $40^{\circ} \mathrm{C}$.

## important notes

The battery should be fed by d.c. Adequate heat removal on the hot side should be provided; a short period of operation without cooling will cause destruction of the battery. The terminals on which the polarity is indicated, should never be reversed. For protection against oxidation the contact surfaces are provided with a protecting layer, which must be removed before use.

## PELTIER BATTERIES

## HIGH CURRENT TYPE PT 20/20

The Peltier-battery PT $20 / 20$ is a 2 V cooling unit, which consists of a series connection of 20 semiconductor thermoelements made of bismuth telluride.

The unit is so designed that adequate insulation is ensured, so that the designer is free from the difficult problem of electric insulation. The easily accessible mounting holes permit easy mounting of heat exchangers or water containers, and facilitate fixing to a wall of a vessel. Mounting of the cooling unit can be done in any position. If a big cooling capacity is required, several units can be combined.

Cooling capacity and current versus temperature, measured for a warm-side temperature of $20^{\circ} \mathrm{C}$.
$T_{\mathrm{k}}=$ temperature of the cold plate. $Q_{\mathrm{k}}=$ cooling capacity in watts.

Cooling capacity and current versus temperature, measured for a warm-side temperature of $40^{\circ} \mathrm{C}$.
$T_{\mathrm{k}}=$ temperature of the cold plate.
$Q_{\mathrm{k}}=$ cooling capacity in watts.

Cooling device to be attached to the warm side of this particular type, type number AM450071.0

## PELTIER BATTERIES

## TYPE PT 48/6

Spring nut (fits M3 screw)

The Peltier battery PT $48 / 6$ is a cooling unit which is, because of its low current (max. 6A), very suitable for cooling purposes in which the cooling capacity must be controlled.

```
weight . . . . . . . . . . . . . . . . . . . . . . . . . . }310\textrm{g
maximum working current . . . . . . . . . . . . . . . . . }6\mathrm{ A Ac
voltage at max. working current . . . . . . . . . . . . . . approx. 4.8 V de
internal resistance . . . . . . . . . . . . . . . . . . . . approx. }800\textrm{m}
maximum }4\textrm{T}(\mp@subsup{\textrm{T}}{\textrm{w}}{}=2\mp@subsup{0}{}{\circ}\textrm{C}) . . . . . . . . . . . . . . . . . 48 deg. C
maximum cooling capacity ( }1\textrm{T}=0\mathrm{ ) . . . . . . . . . . . . . 13.5 W
maximum permissible temperature . . . . . . . . . . . . . 100 
```

The unit consist of 48 (semiconductor) thermoelements made of bismuth telluride which are connected in series electrically. Adequate electrical insulation is ensured. The battery is very robust and is protected against humidity by means of a caoutchouc layer. It can be mounted in any position by means of the six additional M3 spring nuts.
A larger cooling capacity can be achieved by combining several batteries.
The battery is also available provided with one or two liquid containers, soldered to the warm and/or the cold side, with two terminals for rubber or plastic tubing.
The warm side of the battery is marked with a red stripe.

TYPE PT 48/6

Temperature of cold side and temperature difference plotted against cooling capacity with the current as a parameter and a warm side temperature of $20^{\circ} \mathrm{C}$.

Temperature difference plotted against cooling capacity with the warm side temperature as a parameter at optimum working current.
$\mathrm{T}_{\mathrm{w}}=$ temperature of the warm plate in ${ }^{\circ} \mathrm{C}$ $\mathrm{T}_{\mathrm{k}}=$ temperature of the cold plate in ${ }^{\circ} \mathrm{C}$ $\mathrm{Q}_{\mathrm{k}}=$ cooling capacity in watts
$\Delta \mathrm{T}=$ temperature difference between cold and warm side

The Peltier battery should not be used as a construction element for mechanical power transmission. The maximum compressive load, perpendicular to the flanges, must not exceed $0.5 \mathrm{~kg} / \mathrm{cm}^{2}$. The maximum tensile load, perpendicular to the flanges, must no exceed $0.02 \mathrm{~kg} / \mathrm{cm}^{2}$.
The maximum shearing force in the diagonal direction on either flange must not exceed 1 kg .
The battery withstands the following life tests:
(a) continuous operation during 10,000 hours at maximum current
(b) 3,000 switchings; 20 minutes on, 20 minutes off, at maximum current
(c) commutation test; during 2,000 hours the battery is operated at a temperature of $10-20^{\circ} \mathrm{C}$ on one side, and on the other side alternately 20 minutes at $-25^{\circ} \mathrm{C}$ and 20 minutes at $+80^{\circ} \mathrm{C}$.

Adequate heat removal on the warm side should be provided, a short period of operation without cooling will cause irreparable damage to the battery.
For protection against oxidation the contact surfaces are provided with a protective layer, which must be removed before use.

PIEZOXIDE

## Types PXE1, PXE3, PXE4 and PXE5

Piezoelectric materials have the exceptional property of converting mechanical energy into electrical energy, or the reverse, in direct proportion to the energy applied. They will generate electrical energy when squeezed, bent or twisted, or, when electrical energy is applied to them, their shape will be changed.

Piezoxide is a new piezo-electric ceramic material mainly based on lead zirconate titanate. It is suitable for almost any electro-mechanical energy conversion job. At low energy levels it can be employed at both the receiving and the transmitting end, but it is equally well suited to high-energy conditions. Piezoxide exhibits a number of advantageous properties when compared with the older bariumtitanate ceramics, and such properties have been enhanced in the various types of the oxide.

This ceramic material can be sintered in practically any shape, thus permitting special wishes from customers to be fulfilled.

Only four types have been retained for full development, because these ensure coverage of the whole range of possible applications. They are:

PXE 1 Corresponds, in almost all its properties, to the older piezo-electric ceramic materials of the barium titanate type. It is suitable for many applications; of very high quality, albeit with a rather low Curie point.

PXE 3 A genuine lead zirconate titanate with a high Curie point, of high mechanical quality, and with an exceptionally low dielectric constant (high impedances); very high piezo-electric voltage constant.

PXE 4 A material of high mechanical quality, introducing only low losses and having all the properties required for use in tuned elements in ultrasonics.

PXE 5 To be recommended for all electro-mechanical energy convertors that have to operate over a wide frequency range, or will not be tuned. It combines a high sensitivity with a high dielectric constant and ditto internal resistance.

## COLOUR CODE FOR RESISTORS AND CAPACITORS

[^0]:    ${ }^{1}$ Internal resistance of power supply $=250 \Omega$
    ${ }^{2} \mathrm{~A}$ beam current increase of $200 \mu \mathrm{~A}$ results in an amplitude increase of max. $2 \%$.

[^40]:    Resistance values: E24 series; ${ }^{2}$ ambient temperature

[^41]:    * Preferred resistance values

[^42]:    $W_{\text {max }}=1 \mathrm{~W}$
    $\mathrm{T}_{\text {max }}=120^{\circ} \mathrm{C}$

[^43]:    * For more information see disc thermistors series B (page E42).

[^44]:    ${ }^{1}$ ) These measurements are based on a combination of the VDR and a coil. Full test conditions will be sent on request.

[^45]:    ${ }^{1}$ The E 295ZZ/02 has an extra orange colour dot.

[^46]:    ${ }^{1}$ 4-40NC-2B

[^47]:    ${ }^{1} C, D$, represents the minimum creeping distance between the live parts.

[^48]:    a $=$ bottom in oil, lead-in directly connected to the mains
    $\mathrm{b}=$ bottom in oil, lead-in not directly connected to the mains
    $c=$ bottom in air ( min .700 mm mercury), lead-in directly connected to the mains
    $\mathrm{d}=$ bottom in air ( min .700 mm mercury), lead-in not directly connected to the mains.

[^49]:    ${ }^{1}$ Silver plated; ${ }^{2}$ Gold plated; (-) BVA registration number; (p.w.) printed wiring version, 50 pcs

[^50]:    Main dimensions:
    outer diameter. . . . . . . . 105.2 mm
    total depth max. . . . . . . . 30 mm

[^51]:    ${ }^{1}$ ) fundamental; ${ }^{2}$ ) 3rd overtone; ${ }^{3}$ ) 5th overtone; ${ }^{4}$ ) For data see EP 4823A
    F100

[^52]:    ${ }^{1}$ Spindles are available in two lengths: 300 mm for 2 transformers, type number 432202608351
    450 mm for 3 transformers, type number 432202608361

[^53]:    ${ }^{1}$ Serves to mount the motor drive on the transformer. The number of parts in the set depends on whether it concerns a single or a stacked transformer.
    ${ }^{2}$ Additional switches to rotate the transformer to certain pre-determined intermediate positions. Set 84538 contains two switches for the two extreme positions.
    ${ }^{3}$ To calculate the rotation time (limit to limit) when using the AU5300/80. . series of gearboxes, multiply their gear reduction i by $1 / 50$, which yields the time in minutes.

[^54]:    Turn shaft end CW (clockwise) or CCW (counter-clockwise) to increase output voltage.
    ${ }^{2}$ This is the voltage drop from A to the slider C when C-B is loaded with $I_{\text {nom }}$.

[^56]:    a Preferred types

[^57]:    ${ }^{1}$ Preferred types

[^58]:    ${ }^{1}$ Preferred types

[^59]:    ${ }^{1}$ Freferred types

[^60]:    ${ }^{2}$ For single hole beads see under tubes, page G. 14

[^61]:    ${ }^{1} D_{2}=15.9 \pm 0.2$.

[^62]:    ${ }^{1}$ Notches in back.

[^63]:    ${ }^{2}$ For mounting on conventional panels as well as on printed-wiring boards. For panel mounting use fixing bush B1 39185 and nut B1 43653.

[^64]:    ${ }^{1}$ Preferred types

[^65]:    $A_{L}$ is the inductance per turn in nanohenry $\left(10^{-9} H\right), \quad L_{n H}=N^{2} A_{L}$
    ${ }^{1}$ For pre-adjusted potcores provided with the nut 432202130160 , the type number should be extended by the addition $/ 01$.

[^66]:    ${ }^{1}$ The date on the transducers are expressed in terms of the total number of turns $n$, except those on the multiplewindow. They are expressed in terms of the number of turns per individual limb $n$.
    2 These transducers are supplied marked according to groups with narrow tolerance on $f_{a}$.
    ${ }^{3}$ The inside of a ring is the radiating surface, the outer surface is covered by cell-tight foam rubber. Window and multiple-window transducers are placed in water on a sheet of cell-tight foam rubber, their limbs being covered by pressure-release material.
    4 For conversion of parallel resistance and reactance into series resistance and reactance see Fig. 6.

[^67]:    ${ }^{5}$ The mechanical quality factor and the electrical resistance of a cement-coupled non-submerged transducer are highly dependent on the water level and on the geometry and material of the vessel. With only one transducer cement-coupled to a small vessel the resistance range may extend from $1 / 3$ to $5 / 3$ times the listed value. Much smaller tolerances, however, can be obtained when arrays of cement-coupled transducers are used (e.g. large tanks).
    ${ }^{6}$ The frequency of maximum efficiency of a cement-coupled transducer is slightly lower than that of the free (or submerged) transducer, because the tank wall represents an additional mass loading. A steel wall of 1 mm thickness usually causes a frequency decrease of 0.3 to $1.0 \mathrm{kc} / \mathrm{s}$.
    ${ }^{7}$ These rating values presuppose a $\mathrm{Q}_{\text {load }}$ not above 100 , otherwise they must be reduced inversely proportional.

[^68]:    ${ }_{2}^{1}$ In ferroxdure 100, rods are extruded. Discs may be cut from rods which means that values may be a bit lower;
    ${ }^{2}$ Measured at room temperature $\left(20^{\circ} \mathrm{C}\right)$. ${ }^{3}$ It should be noted that the minimum values of $\mathrm{B}_{\mathrm{r}}$ and $\mathrm{H}_{\mathrm{c}}$ never occur simultaneously.
    Temperature coefficient. With ferroxdure 100 the effect of variations in temperature on the induction is practically reversible. In other words, after temporarily heating or cooling, the starting point on the BH curve is regained within 1 or 2 percent without remagnetization being necessary. Only after heating above the Curie point does permanent demagnetization occur. The same applies to anisotropic ferroxdure, but with this material care should be taken that when cooling the magnets below room temperature (which gives an increase of $B$ and a decrease of $H$ ) the working point of the magnets does not pass the knee of the demagnetization curve. Otherwise a lower working point will be obtained after reheating to the original temperature (see leaflet "Ferroxdure Permanent Magnets"). The newer materials ferroxdure 360 R and 330 K are in this respect less sensitive due to the higher coercivity values, resulting in a favourable shift of the knee.

[^69]:    ${ }^{1}$ Magnetic properties in all directions equal. ${ }^{2}$ It should be noted that the minimum values of $\mathrm{B}_{\mathrm{r}}$ and $\mathrm{H}_{\mathrm{c}}$ never occur simultaneously.

[^70]:    ${ }^{1}$ Magnetic properties in the preferred direction optimal; ${ }^{2}$ It should be noted that the minimum values of $\mathrm{Br}_{\mathrm{r}}$ and $\mathrm{H}_{\mathrm{c}}$ never occur simultaneously; ${ }^{3} \mathrm{New}$ material.

[^71]:    ${ }^{1}$ Magnetic properties in the preferred direction optimal. ${ }^{2}$ It should be noted that the minimum values of $B$ and $H$ never occur simultaneously.

[^72]:    ${ }^{1}$ Outer diameter provided with 3 slots

[^73]:    ${ }^{2}$ Magnets are not magnetised.

[^74]:    ${ }^{1} 4 \mathrm{p}$ axially magnetised.
    H2O
