Part 1b August 1977

Transmitting tubes for communication

Tubes for r.f. heating

Amplifier circuit assemblies

ELECTRON TUBES

Part 1b **AUGUST 1977**

DATA HANDBOOK SYSTEM

Our Data Handbook System is a comprehensive source of information on electronic components, subassemblies and materials; it is made up of three series of handbooks each comprising several parts.

ELECTRON TUBES	**BLUE**
SEMICONDUCTORS AND INTEGRATED CIRCUITS	**RED**
COMPONENTS AND MATERIALS	**GREEN**

The several parts contain all pertinent data available at the time of publication, and each is revised and reissued periodically.

Where ratings or specifications differ from those published in the preceding edition they are pointed out by arrows. Where application information is given it is advisory and does not form part of the product specification.

If you need confirmation that the published data about any of our products are the latest available, please contact our representative. He is at your service and will be glad to answer your inquiries.

ELECTRON TUBES (BLUE SERIES)

This series consists of the following parts, issued on the dates indicated.

Part 1a	**Transmitting tubes for communication** **Tubes for r.f. heating**	**Types PE05/25 – TBW15/25**	**December 1975**
Part 1b	**Transmitting tubes for communication** **Tubes for r.f. heating** **Amplifier circuit assemblies**		**August 1977**
Part 2	**Microwave products**		**May 1976**
	Communication magnetrons Magnetrons for microwave heating Klystrons Travelling-wave tubes Isolators, Circulators	Diodes Triodes T-R switches Microwave semiconductor devices	
Part 3	**Special Quality tubes** **Miscellaneous devices**		**January 1975**
Part 4	**Receiving tubes**		**March 1975**
Part 5a	**Cathode-ray tubes**		**August 1976**
Part 5b	**Camera tubes** **Image intensifier tubes**		**May 1975**
Part 6	**Products for nuclear technology**		**January 1977**
	Channel electron multipliers Neutron tubes	Geiger-Müller tubes	
Part 7a	**Gas-filled tubes**		**March 1977**
	Thyratrons Industrial rectifying tubes	Ignitrons High-voltage rectifying tubes	
Part 7b	**Gas-filled tubes**		**March 1977**
	Segment indicator tubes Indicator tubes	Switching diodes Dry reed contact units	
Part 8	**TV picture tubes**		**May 1977**
Part 9	**Photomultiplier tubes** **Phototubes (diodes)**		**June 1976**

SEMICONDUCTORS AND INTEGRATED CIRCUITS (RED SERIES)

This series consists of the following parts, issued on the dates indicated.

Part 1a **Rectifier diodes, thyristors, triacs** **March 1976**

Rectifier diodes
Voltage regulator diodes (> 1,5 W)
Transient suppressor diodes
Rectifier stacks
Thyristors
Triacs

Part 1b **Diodes** **May 1977**

Small signal germanium diodes
Small signal silicon diodes
Special diodes
Voltage regulator diodes (< 1,5 W)
Voltage reference diodes
Tuner diodes

Part 2 **Low-frequency transistors** **December 1975**

Part 3 **High-frequency and switching transistors** **April 1976**

Part 4a **Special semiconductors** **June 1976**

Transmitting transistors
Microwave devices
Field-effect transistors
Dual transistors
Microminiature devices for thick- and thin-film circuits

Part 4b **Devices for optoelectronics** **July 1976**

Photosensitive diodes and transistors
Light emitting diodes
Displays
Photocouplers
Infrared sensitive devices
Photoconductive devices

Part 5a **Professional analogue integrated circuits** **November 1976**

Part 5b **Consumer integrated circuits** **March 1977**

Radio - Audio
Television

Part 6 **Digital integrated circuits** **May 1976**

LOCMOS HE family
GZ family

COMPONENTS AND MATERIALS (GREEN SERIES)

This series consists of the following parts, issued on the dates indicated.

Part 1	**Assemblies for industrial use**		**June 1977**
	High noise immunity logic FZ/30-Series Counter modules 50-Series NORbits 60-Series, 61-Series Circuit blocks 90-Series Circuit block CSA70 (L)	PLC modules Input/output devices Hybrid circuits Peripheral devices Ferrite core memory products	
Part 2a	**Resistors**		**February 1976**
	Fixed resistors Variable resistors Voltage dependent resistors (VDR) Light dependent resistors (LDR)	Negative temperature coefficient thermistors (NTC) Positive temperature coefficient thermistors (PTC) Test switches	
Part 2b	**Capacitors**		**April 1976**
	Electrolytic and solid capacitors Paper capacitors and film capacitors	Ceramic capacitors Variable capacitors	
Part 3	**Radio, Audio, Television**		**January 1977**
	FM tuners Loudspeakers Television tuners and aerial input assemblies	Components for black and white television Components for colour television	
Part 4a	**Soft ferrites**		**October 1976**
	Ferrites for radio, audio and television Beads and chokes	Ferroxcube potcores and square cores Ferroxcube transformer cores	
Part 4b	**Piezoelectric ceramics, Permanent magnet materials**		**December 1976**
Part 5	**Ferrite core memory products**		**July 1975**
	Ferroxcube memory cores Matrix planes and stacks	Core memory systems	
Part 6	**Electric motors and accessories**		**April 1977**
	Small synchronous motors Stepper motors	Miniature direct current motors	
Part 7	**Circuit blocks**		**September 1971**
	Circuit blocks 100 kHz-Series Circuit blocks 1-Series Circuit blocks 10-Series	Circuit blocks for ferrite core memory drive	
Part 8	**Variable mains transformers**		**February 1977**
Part 9	**Piezoelectric quartz devices**		**March 1976**
Part 10	**Connectors**		**November 1975**

General section

TRANSMITTING TUBES FOR COMMUNICATION

TUBES FOR R.F. HEATING

LIST OF SYMBOLS

1. Symbols denoting electrodes and electrode connections

Anode	a
Beam plates	bp
Filament or heater	f
Filament or heater tap or starpoint of three star-connected filaments	f_c
Filament (and cathode) R.F. connection	f(k)
Grid	g
Tube pin which must not be connected externally	i.c.
Cathode	k
External conductive coating	m
Internal shield	s

Remarks

a. Similar electrodes of the same electrode system are distinguished by means of an additional numeral; the electrode nearest to the cathode has the smallest number. Example: with pentodes: g_1, g_2, g_3.

b. Equivalent electrodes of a multi-unit tube are distinguished by means of an apostrophe; e.g. the anodes of a double tetrode are indicated by a and a'.

2. Symbols denoting voltages

Remarks

a. In the case of indirectly heated tubes the voltages on the various electrodes are with respect to the cathode; in case of d.c. fed, directly heated tubes with respect to the negative side of the filament, and in case of a.c. fed, directly heated tubes with respect to the electrical centre of the filament, unless otherwise stated.

b. The symbols quoted below represent the average, or mean, values of the concerning voltages, unless otherwise stated.

Anode voltage	V_a
Anode a.c. voltage	$V_{a\sim}$
Anode voltage in cut-off or cold condition	V_{a_0}
Supply voltage of tube elctrodes	V_b

2. Symbols denoting voltages (continued)

Filament or heater voltage	V_f
Grid voltage	V_g
Grid a.c. voltage	$V_{g\sim}$
A.C. input voltage	V_i
Voltage between cathode and heater	V_{kf}
Peak value of a voltage	V_p
RMS value of a voltage	V_{RMS}, V_{rms}
Secondary transformer voltage	V_{tr}

3. Symbols denoting currents

Remarks

a. The direction of positive electrical current flow is opposite to that of electron flow.

b. The symbols quoted below represent the average values of the currents concerned, unless otherwise stated.

Anode current	I_a
Filament or heater current	I_f
Grid current	I_g
Cathode current	I_k
Peak value of a current	I_p
RMS value of a current	I_{RMS}, I_{rms}
Saturation current	I_{sat}

4. Symbols denoting powers

Anode dissipation	W_a
Driver output power, Driving power	W_{dr}
Grid dissipation	W_g
Anode d.c. supply power	W_{ia}
Input power	W_i
Output power in the load	W_ℓ
Modulation power	W_{mod}
Tube output power	W_o
Peak envelope output power	W_{oPEP}
Oscillator output power	W_{osc}

5. Symbols denoting capacitances

In general the published capacitance values refer to the cold tube

Capacitance between the anode and all other elements except the control grid	C_a
Capacitance between anode and filament (all other elements being earthed)	C_{af}
Capacitance between anode and grid (all other elements being earthed)	C_{ag}
Capacitance between anode and cathode (all other elements not connected to the cathode being earthed)	C_{ak}
Capacitance between grid and filament (all other elements being earthed)	C_{gf}
Capacitance between control grid and all other elements except anode	C_g
Capacitance between two grids (all other elements being earthed)	$C_{g_1g_2}$
Capacitance between grid and cathode (all other elements not connected to the cathode being earthed)	C_{gk}
Input capacitance of a push-pull circuit	C_i
Capacitance between cathode and all other elements	C_k
Output capacitance of a push-pull circuit	C_o

6. Symbols denoting resistances

External a.c. resistance in an anode lead or matching resistance	$R_{a\sim}$
Matching resistance of a push-pull amplifier (anode to anode)	$R_{aa\sim}$
Filament or heater resistance	R_f
Filament or heater resistance in cold condition	R_{fo}
External resistor in a grid lead	R_g
External resistor in a cathode lead	R_k

7. Symbols denoting various quantities

Bandwidth	B
Harmonic distortion factor	d
n-th harmonic distortion	d_n
Total harmonic distortion	d_{tot}

7Z2 4156

7. Symbols denoting various quantities (continued)

Intermodulation distortion	d_i
n-th order intermodulation distortion	d_{i_n}
Frequency	f
Pulse repetition rate	f_{imp}
Height above sea level, altitude	h
Modulation factor	m
Pressure drop of cooling air or cooling water	p_i
Rate of flow of cooling air or cooling water	q
Thermal resistance	R_{th}
Transconductance	S
Temperature of anode block	t_a
Ambient temperature	t_{amb}
Bulb temperature	t_{bulb}
Envelope temperature	t_{env}
Cathode heating time	T_h
Waiting time (time which has to pass between switching on of the filament or heater voltage and switching on of the other voltages)	T_w
Inlet temperature of cooling air or cooling water	t_i
Outlet temperature of cooling air or cooling water	t_o
Pulse duration	T_{imp}
Seal temperature	t_s
Duty factor	δ
Efficiency	η
Wavelength	λ
Amplification factor	μ
Amplification factor of grid no. 2 with respect to grid no. 1	μ_{g2g1}

GENERAL OPERATIONAL RECOMMENDATIONS TRANSMITTING TUBES FOR COMMUNICATION TUBES FOR R.F. HEATING

1. GENERAL

1.1 In this Handbook data and curves are given for transmitting tubes and tubes for R.F. heating.

1.2 The tubes are classified into groups:

Preferred types	- Recommended for new equipment design.
Current types	- Available for equipment production and maintenance. No longer recommended for new equipment design.
Maintenance types	- Available for equipment maintenance. No longer recommended for equipment production.
Obsolescent types	- Available until present stocks are exhausted.
Obsolete types	- No longer available.

For the status of each type please refer to the "Catalogue Transmitting tubes" or consult your tube supplier.
Full details are given of Preferred types and Current types, Data on maintenance and obsolescent types is generally given in condensed form.

2. CHARACTERISTIC DATA

2.1 The characteristic data given in the data sheets is general and independent of specific application. This data (e.g. filament/heater current, amplification factor, transconductance, capacitances etc.) is applicable to a typical tube and deviations from the stated value are likely to occur in practice.

2.2 Filament/heater supply.

The published value of filament/heater voltage is generally that which should be present directly at the tube terminals. Filaments fed with direct current should have their supply polarity reversed at regular intervals (say monthly), to ensure uniform wear of the filament with consequent longer life.
Reduction of filament/heater voltage is sometimes recommended to compensate e.g. the heating by back-bombardment at high frequencies; see the relevant data sheets. Special precautions must be taken when operating the filaments/heaters of transmitting tubes in series and the manufacturer should be consulted before doing so.

2.2.1 Pure tungsten cathodes (filaments)

The published value of filament voltage is the maximum voltage required for a new tube to supply the rated output power. A lower voltage (giving longer life) will often suffice and every tube with a pure tungsten cathode is supplied together with a list stating the saturation current at various filament voltages. Thus, knowing the required emission current, the most suitable filament voltage can be selected. Alternatively the filament voltage can be adjusted until the required output power, or maximum distortion, is reached

and, (to obtain peak output power) further adjusted after modulation is applied. Regular adjustment (say monthly) will be necessary to maintain the required conditions and, towards the end of tube life, the filament voltage may be raised above the nominal.
To compensate for mains supply fluctuations, automatic or manual control of the filament voltage should be exercised, especially when operating at nominal, or higher than nominal, filament voltage.

2.2.2 Thoriated tungsten cathodes (filaments)

The maximum working life from these cathodes is obtained when the filament voltage is held within 1% of the nominal. Underheating and overheating may be harmful so temporary deviations from the nominal voltage must not exceed ± 5%, unless otherwise specified.

2.2.3 Quick heating cathodes (filaments)

In general, tubes with quick heating cathodes should have their filaments in parallel only. When a sinusoidal voltage is used for heating the filament, the frequency must not be in the range 200 Hz to 5000 Hz.
When a non-sinusoidal voltage from a d.c.-a.c. converter is used the r.m.s. value should be adjusted to the published value of filament voltage.
If required the heating time can be further reduced by applying a higher value for a short time. The manufacturer should be consulted before doing so.

2.2.4 Indirectly heated oxide coated cathodes

For maximum life the heater voltage should be as near as possible to the nominal value and the maximum permissible deviation must not exceed 10%, unless otherwise specified.
R.F. voltages between heater and cathode may induce faulty r.f. insulation with resultant r.f. power losses. To overcome these losses an increase in the driving power would be required resulting in an increase of cathode temperature with a consequent reduction of tube life. Such r.f. voltages should therefore be avoided e.g. by using one of the following techniques:

- by-passing the heater to cathode insulation and decoupling the heater at v.h.f. and u.h.f.

- r.f. blocking with series chokes in heater supply leads and decoupling with capacitors.

2.2.5 Switching on the filament voltage

Unless a maximum switch-on value of filament current is stated in the data sheet, switching on at full filament voltage is permissible. The published values of the maximum permissible filament current during switch on, refer to the absolute maximum of the instantaneous value under worst case conditions. With a.c. feed this will exist when switching on at the instantaneous peak voltage of the highest mains voltage that may occur. In practice the filament current during switching on can be limited by means of a filament transformer with high magnetic leakage or a series choke or resistor in the primary of the transformer. If necessary this choke or resistor may be short circuited by means of a relay after a delay of, say, 15 seconds.

2.2.6 By-passing the filament

Tubes with directly heated cathodes must have the filament terminals at the same r.f. potential. For this purpose it is usual to connect a capacitor, that has low reactance with respect to the operating frequency, near to and between the filament terminals. As an added safety precaution it should be established that the resonance of this capacitor together with the inductance of the filament structure falls well below the operating frequency.

2.3 Switching on of the electrode voltages

Unless prescribed otherwise simultaneous switching on of filament, anode, control-grid, and screen-grid voltages is permissible for tubes with an internal anode. Tubes with an external anode should in general not have their positive voltages applied until the cathode has reached its operating temperature. This can be checked by monitoring the filament current.

2.4 Effective cathode

If both filament limbs are marked "f" in the data sheets, the filament may be regarded as being symmetrical in its function as cathode. If such a filament is fed with d.c. the anode return lead should be connected to the negative end of the filament. All other decoupling and circuit returns must then also be connected to this point.

If the filament is fed with a.c. the anode return lead should be connected to the centre-tap of the filament transformer or to a tapped resistor shunted across the filament. The filament decoupling will then be symmetrical with regard to this point and all other circuit returns must also made to this point.

If one filament limb is marked "f" and the other "f(k)", only the one marked "f(k)" may be used as the circuit cathode. If such a filament is fed with d.c., the negative side of the filament supply should be connected to this point.

For either d.c. or a.c. filament supply, the anode supply as well as de-coupling and other circuit returns must be connected to "f(k)" only.

2.5 Inter-electrode capacitances

The published values of capacitances are average values measured on the cold tube with no operating voltages; individual deviations may however occur.
The definitions of the capacitance symbols are given in the appropriate list in I.E.C. Publication 100.

2.6 Amplification factor μ and transconductance S

The published values are average values and individual deviations may occur. Normally the conditions at which the values have been measured, are stated.

2.7 Saturation current I_{sat}

Each large tube with a pure tungsten cathode is marked with the value of filament voltage at which the saturation current has the value specified in the data sheet.

2.8 Accessories

Proper functioning of the tubes can be guaranteed only if accessories (sockets, cooling devices etc.) have been supplied, or approved, by the tube manufacturer.

3. LIMITING VALUES

3.1 Limiting values mean the maximum, or minimum, permissible values of the parameters listed. These limits are given either for all operating conditions together, or for a particular application.

3.2 The limiting values are applicable up to the maximum frequency stated. When operating at higher frequencies the limiting values must be decreased in accordance with the published data or curves.

3.3 Derating the limiting values

If no limiting values have been published for a specific application the derating factors listed in the following table must be applied. The values for class C telegraphy have been expressed as unity; the limiting values for other applications have been expressed as a factor of this unity.
A rectified 3-phase supply with or without filtering is equivalent to a d.c. supply.
The derating factors are determined by the physical limits of the tube and contain no safety margins. Where mains voltage fluctuations occur further derating must be applied (see section 3.5). The nature of operation, e.g. the industrial application of heating generators may necessitate further safety derating (see section 5.4).

Wo = tungsten filament Th = thoriated tungsten filament

		V_a	I_a	I_g	W_{ia}	W_a	W_{g2}
R.F. class C telegraphy		1	1	1	1	1	1
Anode mod.	Th	0.8	0.833	1	0.67	0.67	0.67
	Wo	0.8	0.5	1	0.4	0.4	0.4
R.F. class B	Th	1	0.833	1	0.833 [1])	1	0.67
	Wo	1	0.5	1	0.5	1	0.5
A.F. class B		1	1	1	1	1	1
A.F. class AB		1	1	1	1	1	1
A.F. class A		1	1		W_a	1	1
Self-rectifying oscillator	Th	1.13	0.53	0.53	0.665	1	
	Wo	1.13	0.32	0.32	0.4	1	
Two-phase half-wave without filter	Th	0.9	0.89	0.89	1	1	
	Wo	0.9	0.6	0.6	1	1	

[1]) or 1.5 W_a.

3.4 Rating system

The limiting values should be used in accordance with the "Absolute maximum rating system" as defined by I.E.C. Publication 134.

3.5 Absolute maximum rating system

Absolute maximum ratings are limiting values of operating and environmental conditions applicable to any electronic device of a specified type as defined by its published data, and should not be exceeded under the worst probable conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device, taking no responsibility for equipment variations, environmental variations, and the effects of changes in operating conditions due to variations in the characteristics of the device under consideration and of all other electronic devices in the equipment.
The equipment manufacturer should design so that, initially and throughout life, no absolute maximum value for the intended service is exceeded with any device under the worst probable operating conditions with respect to supply voltage variation, equipment components variation, equipment control adjustment, load variations, signal variation, environmental conditions, and variations in characteristics of the device under consideration and of all other electronic devices in the equipment.

3.6 Each limiting value should be regarded independently of other values; under no circumstances is any limiting value to be exceeded (e.g. if the anode voltage is decreased to a value lower than its limiting value, it is not permissible to exceed the limiting value of anode current or anode dissipation). Unless otherwise stated, the limiting values for currents and voltages are measured with a moving coil instrument.

3.7 Electrode voltages

The voltages (V_a, V_{g1}, V_{g2} etc.) listed under limiting values should not be exceeded even with a cold tube. Special attention should be paid to this point when a screen-grid is supplied via a series resistor.
When designing equipment to be supplied from non-stabilized mains, the maximum mains voltage occurring determines the nominal operating voltages of the tube. These nominal voltages must be lower than the limiting values. Should the transmitting tubes, and thus the voltage supply, be temporarily under a lower load their voltages will increase and these increased values, occurring at the highest mains voltage, determine the nominal operating voltages.
The limiting values of voltage are d.c. values. If an a.c. or an unsmoothed d.c. supply is used, the limiting values must be decreased in accordance with the derating factors shown in the table (section 3.3).

3.8 Anode dissipation

The limiting value of the anode dissipation W_a should not be exceeded when mains voltage fluctuations occur, or when grid drive fails. To prevent damage to the tube, in the latter case, adequate fixed bias or a quick action relay in the anode lead should be provided. When forced-air or water-cooling is sufficient only for an anode dissipation smaller than the absolute maximum, the smaller value must be regarded as the limiting value.

3.9 Anode input power

Usually the data sheets show the limiting value of input power W_{i_a} to be smaller than the product of limiting values of anode voltage and anode current; the latter two limits should not therefore occur simultaneously.
In practice the input power W_{i_a} is not always the product of the d.c. values of I_a and V_a. For pulsating supply voltages the form factor should be taken into account.

3.10 For the screen-grid dissipation the product of screen-grid voltage and current can always be taken.
The screen-grid should be protected against failure of anode voltage.

3.11 Control-grid dissipation

The control-grid dissipation W_g or W_{g1} can be approximated, by taking the power supplied to the grid bias source ($-V_g \times I_g$) from the grid driving power (approx. $0.95 \times V_{g_p} \times I_g$). When an a.c., or unsmoothed d.c., voltage supply is used the form factor should be taken into account.

3.12 Grid resistance

By the maximum permissible grid resistance R_g is meant the d.c. resistance in the grid circuit. A higher value may cause instability.

4. OPERATING CONDITIONS

4.1 General

In the published data, operating conditions for various applications have been given, stating the maximum frequency at which the conditions apply. If it is required to operate a tube at higher frequencies the manufacturer should be consulted. The published values of operating conditions are average values derived from measurements made on nominal tubes working under optimum conditions. Thus, small deviations from the published value can occur if measurements are made on a particular tube. However some of the measured values of voltage or current must be adjusted to give the published figure. As an example, the published value of output power is an average value which can be reached in practice by adjusting e.g. the r.f. or a.f. input voltage V_{gp}, when the published value of output power is not obtained at the nominal value of V_{gp}. When designing a multi-stage transmitter it is good practice to leave a margin in the output power and input voltage to allow for adjustments similar to that just described. The published output power W_o of transmitting tubes is the tube output, which means the anode dissipation W_a taken from the anode input W_{i_a}. When a tube is used in a common grid circuit (grounded grid circuit), the published value of the output power includes the power transferred from the input.

Unless otherwise stated losses in the anode circuit and coupling losses are not taken into account.

The quoted grid input power is assumed to be 0.9 x the product of the average grid current I_g and the peak value of the grid voltage V_{gp}. Losses in the grid circuit and the bleeder are sometimes accounted for by stating the required driver output power.

At high frequencies where reduced ratings have to be applied, the required driving power will often be considerably higher than the grid input power, and in some cases, may be determined almost exclusively by circuit losses.

4.2 R.F. class C telegraphy and F.M. telephony

A class C amplifier or oscillator is one in which the grid bias is appreciably greater than the cut-off voltage so that current flows for less than one half of each cycle of the alternating grid voltage. working to the values published in the data sheets will ensure good output power and efficiency.

If a grid resistor is used for obtaining automatic bias, care must be taken that the anode current does not become too high if the r.f. driving power should fail. A safety device in the anode or screen-grid lead should be incorporated for this purpose.

4.3 R.F.class C anode and screen-grid modulation

In an r.f. class C anode modulated stage the anode voltage is modulated with a.f., and at 100 % modulation the voltage is varied from zero to twice the d.c. value. With tetrodes or pentodes the screen-grid shpuld also be modulated to prevent it being overloaded. The average values of the grid bias and r.f. driving voltage remain constant during modulation. With 100 % modulation the average anode dissipation is 1.5 times the value without modulation and this is taken into account although the published limiting value of anode dissipation refers to the unmodulated power. Automatic grid bias by means of a grid leak can be used, but, to obtain minimum distortion, some fixed bias is recommended.

The modulation power published is the power required by the modulated r.f. stage. When the modulating stage is being calculated 5% to 10% must be added to allow for losses in transformer and choke.

4.4 R.F. class B telephony

A class B amplifier is one in which the grid is biased to the cut-off voltage so that the anode current flows for approximately one half of each cycle of the alternating grid voltage. The published data for r.f. class B telephony has been determined, by trial and error, to give a straight modulation characteristic.

4.5 R.F. class AB SSB amplifier

The given operating conditions are from measurements made in a circuit without feedback and with constant screen-grid voltage. They show the best compromise between output power and linearity. Linearity is measured with a double tone test signal in which the two tones have equal amplitude and lie 1000 Hz apart in frequency. The amplitudes of the distortion products d_3 and d_5 are in dB referred to the amplitude of either of the two equal tones. The published values of d_3 and d_5 are the worst encountered at any driving level and occur usually slightly below full output power. Distortion products of orders other than d_3 and d_5 are, in general, negligible. If the amplitudes of the distortion products are referred to the peak envelope amplitude, the figures for d_3 and d_5 go down 6 dB.

4.6 A.F. class B amplifier

With this amplifier the anode dissipation is dependent on the input signal voltage so that maximum anode dissipation is obtained when the signal is about 60% of the value at full drive. When this is not present continuously, as is the case with broadcast and telephony services, it is permissible for the limiting value of anode dissipation to be exceeded by 10%.
To suppress even harmonics, separate controllable grid bias for each tube, or a balancing circuit, should be incorporated. This data is purely arbitrary, i.e. the same output can be obtained with less modulation of the anode current (with smaller load resistance and lower peak grid current) although the efficiency would be lower. The requirements of the complete a.f. amplifier determines which kind of operation is preferred.

4.7 Industrial operating conditions

Section 5.4 gives some general information on the application of power tubes in industrial apparatus. With a single phase mains connection a hum filter will sometimes be omitted as is normal in three phase mains connection. Operating conditions and derating factors are given for this kind of operation (section 3.3). It must be ensured that no limiting values are exceeded because of fluctuations in the mains supply or by tolerances in other components. The published value of W_o is the actual tube output power. The output power of a self-oscillating circuit W_{osc} is obtained by deducting the grid dissipation W_g and the losses in the grid resistor W_{Rg} from the output power W_o, The power in the load W_l is obtained by deducting the losses in the output circuit from W_{osc}. A favourable load output characteristic may be obtained by automatically controlling the grid voltage and current, depending on the matching. A non-linear device e.g. a tungsten lamp or an P.T.C. resistor may perform this function

adequately and help to prevent overloading the grid.
With self oscillating circuits the frequency must be held within the available frequency band. This may be done by having large circuit capacitance, small stable self inductance, undercritical inductive coupling with the output circuit, electrostatic screening between oscillator and output circuit etc.
If the frequency of an industrial oscillator has to be limited to a narrow frequency band, crystal controlled driving stages may be used, then however, it is rather difficult to obtain matching between the tube input and output. A greater safety margin in the tube will be necessary with the output still depending on the load, or special measures, such as automatic tuning and/or matching control, will have to be taken.
For smaller tubes in industrial applications operating conditions have been given for when power is supplied from a single phase full-wave rectifier, a three phase half-wave rectifier (which is nearly equivalent to d.c.) and with raw a.c. In the latter case the output is about 0.6 times that obtained with d.c. and the peak inverse voltage is equal to the full anode voltage (this is of special importance as the grid voltage is in anti-phase to the anode voltage). With a single-phase, half-wave rectified anode voltage the useful output is nearly equal to that with a d.c. supply. To obtain the most favourable mains loading when using a self rectifying oscillator, a quasi push-pull circuit can be used, in which two tubes function alternately on each half wave. The best mains loading for three-phase, self rectification is obtained by using 6 tubes in a triple push-pull circuit.

4.8 Intermittent service

When data concerning intermittent service is published it is conditional that, although the cathode may be heated continuously, the on-period is no more than 5 minutes and that the off-period is equally long or longer.

5. APPLICATION OF THE OPERATING CONDITIONS

5.1 General

It is not always possible to operate the tube under the specified operating conditions. In some applications deviations from the published values are likely to occur causing the limiting values to be exceeded. Depending on the kind of service the following classification can be made:

- Fixed transmitters for broadcasting and telecommunication service, operated by a trained staff. (5.2)
- Mobile transmitters. (5.3)
- Equipment for industrial applications (r.f. heating, supersonics etc.) (5.4)
- Amateur transmitters and special applications. (5.5)
- Pulse operated equipment. (5.6)

5.2 Fixed transmitters

With fixed transmitters it is usually possible to use the tubes under ideal working conditions viz.

- only very small mains voltage deviations as the supply is derived from a special high tension line.
- stabilized mains voltage supply.
- a fairly constant and optimum transmitter load.
- the presence of safety devices which prevent tube damage under any circumstances.
- the presence of a well trained staff for the immediate repair of faults.

and thus it is permissible to operate near the limiting values.

5.3 Mobile transmitters

Mobile transmitters are transmitters which can be operated whilst mobile; they often have to function with widely varying supply voltages and with loads that are neither constant nor optimum. Safety devices are usually poor, especially in small transmitters, so the use of the tube at the published maximum operating conditions is not recommended. The actual operating conditions chosen will depend upon specific circumstances. Because the electrode system in the smaller quick heating or oxide coated transmitting tubes is rugged and can withstand the vibration and occasional shocks experienced in normally used road vehicles the tubes are ideal for mobile transmitters.

However in aircraft and vehicles used over rough ground it is advisable to shockmount the tubes. The oxide coated cathode is fairly insensitive to heater voltage variation and the high specific emission allows lower anode voltages to be used. Generally, when used in any apparatus that is likely to be subjected to shocks or vibration, tubes with thoriated tungsten cathodes require shock damping. If a special device is used to clamp a tube into its socket it must be ensured that the maximum permissible temperature is not exceeded in any part of the envelope.

5.4 Industrial application, r.f. heating, supersonics etc.

For the following reasons, in industrial equipment the tube seldom operates under ideal conditions.

- Large, uncompensated mains voltage fluctuations.
- Voltage supply with no provision against hum.
- Variable load.
- Relative large tolerances on the stability of the operating frequency.
- Intermittent service.
- Service personnel often untrained in the servicing of the electronic power equipment.

Thus the design of industrial equipment differs from that of fixed transmitters and generally demands the use of self oscillating triodes. The most reliable operation of the tube, and hence the equipment, is obtained by selecting a nominal supply potential which, at the maximum mains voltage, does not exceed the limiting value.
In equipment powered by a.c. or unsmoothed d.c., the pulsating waveform is such that the average values of voltage and current chosen must be lower than if they were supplied by a normal d.c. supply.
Special attention should be paid to the grid current and dissipation since, in most cases, they are critical values.
Special cases of intermittent service make it possible to increase the limiting values and information on these possibilities will be supplied on request.

5.4.1 Multiple tube operation

Since industrial generators are largely self oscillating, single tube operation is generally preferred. This mode of operation minimizes the risk of interaction between the tube and circuit stray reactances that could lead to parasitic oscillations. Whenever, for various reasons, such as the suppression of the even harmonics or the need for higher power at higher frequencies, push-pull or parallel operation is chosen, increased attention must be paid to the prevention of interaction between the tubes, be they in push-pull or parallel, through their connections or other stray circuit reactances.

5.5 Amateur transmitters and special adjustments

The maximum permissible load of a tube is determined by the physical maxima of the tube incorporated in the limiting values. No guaranteed tube life can be given if the limiting values are exceeded although this does not imply that exceeding the limits will always result in an immediate breakdown of the tube. In the case of I.C.A.S. (Intermittent Commercial and Amateur Service) for instance, higher operating conditions have been given (see section 4.8) but generally no guarantee of tube life is given. Information about special circuits, adjustments and operating conditions will be supplied on request.

5.6 Pulsed operation

When a tube is used under pulsed operation the pulse duration must be so short that no part of the tube reaches an abnormally high temperature and flash-overs do not develop. In general the average load will be considerably less than the maximum limiting load value.
General information on this kind of information is not available but, if requested, information will be given on specific applications.

6. Conditioning

After transit or a period of storage it is recommended that power tubes should be operated for not less than 15 minutes with only the filaments/heaters energized before puting into full service.

In addition, for tubes operating normally with anode voltages in excess of 5 kV, it is recommended that the anode voltage and input power should be increased gradually or in several steps for a further period of 15 minutes, or longer, until normal operation is achieved.
This treatment will remove any traces of gases which might cause premature failure of the tube.

Transmitting tubes for communication
Tubes for r.f. heating

R.F. POWER TRIODE

Triodes intended for use as H.F. amplifier, oscillator, and modulator.
The YD1000 is water cooled.
The YD1001 is forced-air cooled.
The YD1002 is vapour cooled.

Amplification factor	μ	58	
Transconductance	S	60	mA/V

TEMPERATURE LIMITS

Absolute max. bulb temperature	t_{bulb}	220	^oC
Absolute max. seal temperature	t_s	220	^oC

COOLING

At frequencies higher than 10 MHz a low-velocity air flow should be directed to the grid and filament seals.

YD1000

See cooling curves.
For water inlet temperatures between 20 °C and 50 °C the required quantity of water can be found by proportional interpolation.

YD1001

See cooling curves.
At higher temperatures the amount of air should be increased so that the outlet air temperature is not higher than that at t_i = 25 °C. At lower temperatures the amount of air should be the same as that at t_i = 25 °C.

YD1002

Anode current	I_a	50	5	A
Transconductance	S	140	60	mA/V
Amplification factor		25	25	

TEMPERATURE LIMITS

Absolute maximum bulb and seal temperature — t max 180 °C

COOLING

YD1140

W_a kW	t_i °C	q_{min} ℓ/min	p_i kPa *
30	20	25	15
	50	45	45
50	20	32	25
	50	65	85
100	20	55	60
	50	120	300

At water inlet temperatures between 20 and 50 °C the required quantity of water can be found by linear interpolation.

At frequencies below 6 MHz forced air cooling of the seals will, as a rule, not be necessary. Above 6 MHz air cooling must be used to keep the anode and grid seal temperatures below 180 °C. The seals can be cooled by connecting a blower of suitable size to the air inlet of the anti-corona ring, attached to the tube. At maximum frequency (30 MHz) and published operating conditions, an air flow of 2,5 m^3/min with a pressure loss of about 5 kPa will in general be sufficient. The air flow must be started upon or before the application of filament voltage.

When using the special filament connectors type 40628, together with connecting leads of adequate cross-section, additional air cooling of the filament terminals is, as a rule, not necessary.

Care should be taken to ensure firm contact of the filament terminals in order to obtain equal distribution of current over these terminals.

* 100 kPa ≈ 1 at.

YD1141

W_a kW	h m	t_i °C	q_{min} m^3/min	p_i Pa*
30	0	35	35	1140
	0	45	40	1430
	1500	35	42	1360
	3000	25	44	1320
45	0	35	54	2750
	0	45	62,5	3350
	1500	35	64,5	3220
	3000	25	68	3190

When the tube is used at frequencies above 6 MHz special attention must be paid to the anode and grid seal temperatures. For frequencies below 20 MHz cooling of these seals can be effected by air flowing through the slots at the top of the cooler. In certain cases, e.g. at low dissipation and cooling with the minimum quantity of air, the air flow to the seals will not be sufficient to maintain the seal temperatures below 180 °C. In these cases, and also if it is preferred to close the slots, cooling of the seals should be effected by a separate air flow to the seals.

When using the filament connectors type 40628, together with connecting leads of adequate cross-section, additional air cooling of the filament terminals is, as a rule, not necessary.

Care should be taken to ensure firm contact of the filament terminals in order to obtain equal distribution of current over these terminals.

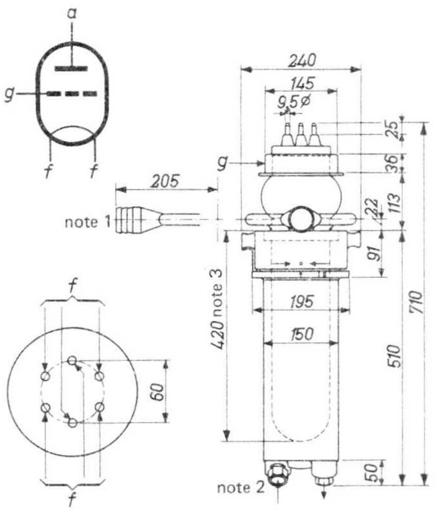
* 1 Pa ≈ 0,1 mm H_2O.

MECHANICAL DATA

Dimensions in mm

YD1140

Net mass: 13,5 kg



Mounting position: vertical with anode down

When connecting the filament the three pins of each group must be joined.

ACCESSORIES

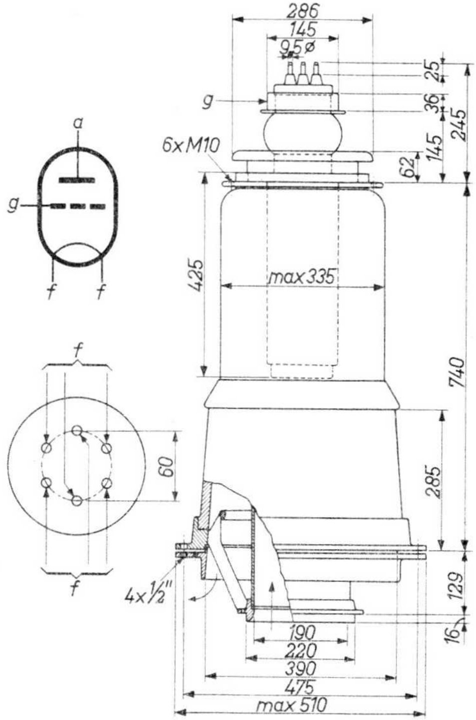
Water jacket	type K714	mass 20,5 kg
Filament connectors	type 40628	
O-ring	cat. no. 2622 080 30916	

Notes

1. Use connecting hose with an inner diameter of 1 3/4″.
2. Coupling for metal tubing with an outer diameter of 28 mm.
3. To remove the tube from its water-jacket, the free height above the tube must be at least 420 mm.

YD1141

Net mass: 26 kg



Tube mounted in cooler housing type K506.

Mounting position: vertical with anode down

When connecting the filament the three pins of each group must be joined.

ACCESSORIES

Cooler housing	type K506	mass 72 kg
Filament connectors	type 40628

HEATING: direct; thoriated tungsten filament

Filament voltage (< 120 MHz)	V_f	6, 3	V
(> 120 MHz)	V_f	6, 0	V
Filament current at V_f = 6, 3 V	I_f	33	A

The filament is designed to accept temporary fluctuations of +5% and −10%.

It is extremely important that the filament be properly decoupled. This should be so done that the resonance of the circuit formed by the filament and decoupling elements remains below the fundamental oscillator frequency. In grounded-grid circuits this resonance should be below the grid-cathode resonance. For further information please see Application Book "Tubes for R.F. heating" or contact the manufacturer.

CAPACITANCES

Anode to filament	C_{af}	0, 4	pF
Grid to filament	C_{gf}	17	pF

Grid dissipation	W_g	290	290	240	W
Grid desistor dissipation	W_{R_g}	300	400	450	W

LIMITING VALUES (Absolute max. rating system)

Frequency for full ratings	f	up to	120	MHz [1]
Anode voltage	V_a	max.	12	kV
Anode current	I_a	max.	4	A
Anode input power	W_{ia}	max.	40	kW
Anode dissipation	W_a	max.	15	kW
Grid voltage	$-V_g$	max.	1, 5	kV
Grid current, on load	I_g	max.	1, 1	A
off load	I_g	max.	1, 6	A
Grid dissipation	W_g	max.	350	W
Grid circuit resistance	R_g	max.	10	kΩ
Cathode current, mean	I_k	max.	5	A
peak	I_{kp}	max.	25	A
Envelope temperature	t_{env}	max.	240	°C

HEATING : direct; filament thoriated tungsten.

Filament voltage	V_f		5, 8	V
Filament current	I_f		130	A
Peak filament starting current	I_{fp}	max.	800	A
Cold filament resistance	R_{f_o}		5, 6	mΩ

The filament is designed to accept temporary fluctuations of + 5 % and − 10 %

To ensure that the cathode temperature remains constant irrespective of the operating frequency it may be necessary to reduce the filament voltage at higher frequencies. When doing so it must be borne in mind that the filament voltage-to-current ratio, as measured with only the filament voltage applied, should remain constant under all operating conditions

It is extremely important that the filament be properly decoupled. This should be so done that the resonance of the circuit formed by the filament and decoupling elements remains below the fundamental oscillator frequency. In grounded-grid circuits this resonance should be below the grid-cathode resonance. For further information please see Application Book "Tubes for R.F. heating" or contact the manufacturer.

[1]) When the tubes are to be used at frequencies above 30 MHz the manufacturer should be consulted for more detailed information.

CAPACITANCES

Anode to filament	C_{af}	0,4	pF
Grid to filament	C_{gf}	47	pF
Anode to grid	C_{ag}	17	pF

CHARACTERISTICS

Transconductance	S	33	mA/V
Amplification factor	μ	44	

COOLING

To obtain optimum life, the temperatures of the seals and of the envelope should, under normal operating conditions, be kept below 200 °C.

To maintain these temperatures additional cooling may be necessary. At frequencies higher than about 4 MHz, cooling of the seals becomes mandatory.

Grid current, on load		I_g	max.	1,6	A
of load		I_g	max.	2,4	A
Grid dissipation		W_g	max.	500	W
Grid circuit resistance		R_g	max.	10	kΩ
Cathode current, mean		I_k	max.	7,5	A
peak		I_{kp}	max.	40	A
Envelope temperature		t_{env}	max.	240	^{o}C

HEATING : direct; thoriated tungsten filament, mesh construction

Filament voltage	V_f		7	V
Filament current	I_f		175	A
Peak filament starting current	I_{fp}	max.	1000	A
Cold filament resistance	R_{fo}		4,2	mΩ

The filament is designed to accept temporary fluctuations of +5% and -10%. To ensure that the cathode temperature remains constant irrespective of the operating frequency, it may be necessary to reduce the filament voltage at higher frequencies. When doing so it must be borne in mind that the filament voltage-to-current ratio measured with only the folament voltage applied should remain constant under all operating conditions.

It is extremely important that the filament be properly decoupled. This should be so done that the resonance of the circuit formed by the filament and decoupling elements remains below the fundamental oscillator frequency. In grounded-grid circuits this resonance should be below the grid-cathode resonance. For further information please see Application Book "Tubes for R.F. heating" or contact the manufacturer.

CAPACITANCES

Anode to filament	C_{af}	1	pF
Grid to filament	C_{gf}	61	pF
Anode to grid	C_{ag}	32	pF

CHARACTERISTICS measured at $V_a = 7$ kV, $I_a = 2,4$ A

Transconductance	S	40	mA/V
Amplification factor	μ	33	

COOLING

To obtain optimum life, the temperature of the seals and of the envelope should, under normal operating conditions, be kept below 200 °C.

To maintain these temperatures additional cooling may be necessary.
At frequencies higher than about 4 MHz cooling of the seals becomes mandatory.

HEATING: direct; thoriated tungsten filament

Filament voltage	V_f		8,4	V
Filament current	I_f		235	A
Peak filament starting current	I_{fp}	max	1500	A
Cold filament resistance	R_{fo}		3,9	mΩ

The filament is designed to accept temporary fluctuations of +5% and −10%.

To ensure that the cathode temperature remains constant irrespective of the operating frequency, it may be necessary to reduce the filament voltage at higher frequencies. When doing so it must be borne in mind that the filament voltage-to-current ratio measured with only the filament voltage applied should remain constant under all operating conditions.

It is extremely important that the filament be properly decoupled. This should be so done that the resonance of the circuit formed by the filament and decoupling elements remains below the fundamental oscillator frequency. In grounded-grid circuits this resonance should be below the grid-to-cathode resonance. For further information please see Application Book "Tubes for R.F. heating" or contact the manufacturer.

* When the tube has to be used at frequencies above 30 MHz the manufacturer should be consulted for more detailed information.

CAPACITANCES

Anode to filament	C_{af}	1,3 pF
Grid to filament	C_{gf}	100 pF
Anode to grid	C_{ag}	45 pF

CHARACTERISTICS measured at V_a = 8 kV, I_a = 6 A

Transconductance	S	90 mA/V
Amplification factor	μ	35

COOLING

To obtain optimum life, the temperature of the seals and the envelope should, under normal operating conditions, be kept below 200 °C. At low frequencies the seals are sufficiently cooled when the filament connectors are water cooled by a flow of about 0,5 ℓ/min. At higher frequencies, however, an additional air flow of about 1 m^3/min must be led along the seals from a 30 mm diameter nozzle positioned at a distance of 200 mm from the tube header.

HEATING : direct; thoriated tungsten filament, mesh construction

Filament voltage	V_f		8,4	V
Filament current	I_f		235	A
Peak filament starting current	I_{fp}	max.	1500	A
Cold filament resistance	R_{fo}		3,9	mΩ

The filament is designed to accept temporary fluctuations of +5% and −10%.

1) When the tubes are to be used at frequencies above 30 MHz the manufacturer should be consulted for more detailed information.

To ensure that the cathode temperature remains constant irrespective of the operating frequency it may be necessary to reduce the filament voltage at higher frequencies. When doing so it must be borne in mind that the filament voltage-to-current ratio measured with only the filament voltage applied should remain constant under all operating conditions.

It is extremely important that the filament be properly decoupled. This should be so done that the resonance of the circuit formed by the filament and decoupling elements remains below the fundamental oscillator frequency. In grounded-grid circuits this resonance should be below the grid-cathode resonance. For further information please see Application Book "Tubes for R.F. heating" or contact the manufacturer.

* 1 Pa ≈ 0,1 mm H_2O.

The above cooling conditions apply to the air flow direction as indicated in the outline drawing. In case of reversed flow direction a larger air volume will be required to keep the anode temperature below the limiting value.

To obtain optimum life, the temperature of the seals and the envelope should, under normal operating conditions, be kept below 200 °C.

YD1197

Absolute max. water inlet temperature	t_i	max.	50	°C
Absolute max. water pressure	p	max.	600	kPa(abs)

To obtain optimum life, the temperature of the seals and the envelope should, under continuously loaded conditions, be kept belwo 200 °C.

At low frequencies the seals are sufficiently cooled when the filament connectors are water cooled with a flow of about 0,5 ℓ/min. At higher frequencies, however, an additional air flow of about 1 m^3/min must be led along the seals from a 30 mm diameter nozzle positioned at a distance of 200 mm from the tube header.

Anode input power	W_{ia}	3.15	3.75	kW
Anode dissipation	W_a	0.75	0.83	kW
Anode output power	W_o	2.4	2.9	kW
Anode efficiency	η_a	76	78	%
Oscillator efficiency	η_{osc}	71	71	%
Feedback ratio	V_{gp}/V_{ap}	17	17	%
Grid resistor	R_g	2.2	2.2	kΩ
Grid current, on load	I_g	225	235	mA
Grid voltage, negative	$-V_g$	495	517	V
Grid dissipation	W_g	70	80	W
Grid resistor dissipation	W_{Rg}	111	121	W

LIMITING VALUES (Absolute max. rating system)

Frequency for full ratings	f	up to	250	MHz
Anode voltage	V_a	max.	5.5	kV
Anode current	I_a	max.	1.1	A
Anode input power	W_{ia}	max.	6.0	kW
Anode dissipation	W_a	max.	1.5	kW
Grid voltage	$-V_g$	max.	1.0	kV
Grid current, on load	I_g	max.	280	mA
off load	I_g	max.	400	mA
Grid dissipation	W_g	max.	150	W
Grid circuit resistance	R_g	max.	20	kΩ
Cathode current, mean	I_k	max.	1.4	A
peak	I_{kp}	max.	8	A
Envelope temperature	t_{env}	max.	240	°C

HEATING :direct; filament thoriated tungsten

Filament voltage	($f \leq 120$ MHz)	V_f	6.3	V
	($f > 120$ MHz)	V_f	6.0	V
Filament current at	$V_f = 6.3$ V	I_f	33	A

The filament is designed to accept temporary fluctuations of +5 % and −10 %.

It is extremely important that the filament be properly decoupled. This should be so done that the resonance of the circuit formed by the filament and decoupling elements reamains below the funamental oscillator frequency. In grounded-grid circuits this resonance should be below the grid-cathode resonance. For further information please see Application Book "Tubes for R.F. heating" or contact the manufacturer.

CAPACITANCES

Anode to filament	C_{af}	0.4	pF
Grid to filament	C_{gf}	17	pF
Anode to grid	C_{ag}	14	pF

CHARACTERISTICS measured at $V_a = 2.0$ kV, $I_a = 0.5$ A

Transconductance	S	10	mA/V
Amplification factor	μ	20	

COOLING

See cooling curves.

A low velocity air flow directed to the seals may be required.

To obtain optimum life, the temperature of the seals and of the envelope should, under normal operating conditions, be kept below 200 °C.

To maintain these temperatures additional cooling maybe necessarey. At frequencies higher than about 4 MHz cooling of the seals becomes mandatory.

ACCESSORIES

Filament connector		type	40688
Filament/cathode connector		type	40689
Grid connector	f < 30 MHz	type	40686
	f > 30 MHz	type	40687

AIR-COOLED R.F. POWER TRIODE

Forced-air cooled coaxial power triode in metal-ceramic construction primarily intended for use as an r.f. class AB linear broad-band amplifier in TV transposer service at frequencies up to 1000 MHz.

QUICK REFERENCE DATA

Transposer service (combined sound and vision)				
Frequency	f	470 to 860	470 to 860	MHz
Anode voltage	V_a	1200	1500	V
Output power in load (sync)	W_ℓ	15	25	W
Power gain	G	20	20	dB
Vision amplifier				
Frequency	f	470 to 860	470 to 860	MHz
Anode voltage	V_a	1200	1500	V
Output power in load (sync)	W_ℓ	15	25	W
Power gain	G	20	20	dB

HEATING: indirect by a.c. or d.c.; oxide coated cathode.

Heater voltage*	V_f		5	V ±5%**
Heater current	I_f		2	A
Cathode heating time	T_h	min	120	s

CAPACITANCES

Anode to grid	C_{ag}		3,5	pF
Grid to cathode and heater	$C_{g/kf}$		17	pF
Anode to cathode and heater	$C_{a/kf}$	<	0,05	pF

TYPICAL CHARACTERISTICS

Anode voltage	V_a	1700	V
Anode current	I_a	170	mA
Transconductance	S	60	mA/V
Amplification factor	μ	200	

* After the circuit has been adjusted for proper tube operation, heater voltage reduction could be necessary (depending on frequency and operating conditions) to prevent overheating of the cathode by back bombardment (resulting in short life).

** For optimum transposer performance (linearity) ±2%.

TEMPERATURE LIMITS

Absolute maximum seal temperature	t_s	max	150	^oC
Absolute maximum anode temperature at reference point	t_a	max	100	^oC

AIR COOLED R.F. POWER TRIODE

Forced-air cooled coaxial power triode in metal-ceramic construction primarily intended for use as R.F. class AB linear broadband amplifier in TV transposer service at frequencies up to 1000 MHz.

QUICK REFERENCE DATA			
Frequency	f	370 to 860	MHz
Anode voltage	V_a	3000	V
Output power in load	W_{ℓ}	220	W
Power gain	G	16,5	dB

HEATING : indirect, by a.c. (50 Hz to 400 Hz) or d.c.; oxide coated cathode.

Heater voltage	V_f	6,0 to	6,3	V ±5% [1])
Heater current	I_f	4,8 to	5,8	A
Cathode heating time	T_h	min.	180	s

CAPACITANCES

Anode to grid	C_{ag}	6,8 to	8,0	pF
Grid to cathode and heater	$C_{g/kf}$	20 to	30	pF
Anode to cathode and heater	$C_{a/kf}$	90 to	180	fF

TYPICAL CHARACTERISTICS

Anode voltage	V_a	3	kV
Anode current	I_a	400	mA
Transconductance	S	70	mA/V
Amplification factor	μ	90	

TEMPERATURE LIMITS

Absolute max. temperature measured at reference points	t	max.	250	^oC

To obtain optimum life, this temperature should not exceed 200 ^oC.

[1]) The heater voltage must be adjusted between 6,0 and 6,3 V.
For optimum performance (linearity) the voltage set must be maintained within ±2% for transposer service, or ± 5% for other applications.

COOLING

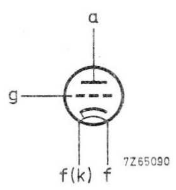
Anode: forced air

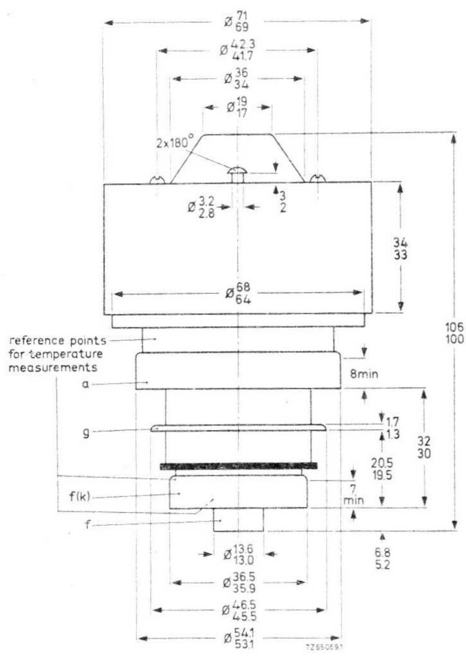
W_a (W)	t_i (°C)	q_{min} (m^3/min)	p_i (mm H_2O)
1800	25	2	180

Other terminals: low velocity air flow.
When only the heater voltage is applied, the heater and heater/cathode terminals should also be cooled.
Cooling air and voltages may be switched off simultaneously.

MECHANICAL DATA

Dimensions in mm





The radiator and the terminals are situated within concentric cylinders of the following dimensions:

Radiator	72,0 dia
Anode terminal	55,1 dia
grid terminal	47,0 dia
Heater/cathode terminal	37,0 dia
Heater terminal	14,5 dia

AIR COOLED R.F. POWER TRIODE

Forced-air cooled coaxial power triode in metal-ceramic construction primarily intended for use as R.F. class AB linear broadband amplifier in TV transposer service at frequencies up to 1000 MHz.

QUICK REFERENCE DATA			
Transposer service (combined sound and vision)			
Frequency	f	470 to 860	MHz
Anode voltage	V_a	2500	V
Output power in load (sync)	W_ℓ	110	W
Power gain	G	16	dB

HEATING : indirect by a.c. (50 Hz to 400 Hz) or d.c.; oxide coated cathode.

Heater voltage	V_f	6,0 to 6,3	V ±5% [1])
Heater current	I_f	4,8 to 5,8	A
Cathode heating time	T_h	min. 180	s

CAPACITANCES

Anode to grid	C_{ag}	6,8 to 8,0	pF
Grid to cathode and heater	$C_{g/kf}$	20 to 30	pF
Anode to cathode and heater	$C_{a/kf}$	90 to 180	fF

TYPICAL CHARACTERISTICS

Anode voltage	V_a	2	kV
Anode current	I_a	250	mA
Transconductance	S	60	mA/V
Amplification factor	μ	90	

TEMPERATURE LIMITS

Absolute max. temperature measured at reference points	t	max. 250	^{o}C

To obtain optimum life, this temperature should not exceed 200 ^{o}C.

[1]) The heater voltage must be adjusted between 6,0 and 6,3 V.
For optimum performance (linearity) the voltage set must be maintained within ±2% for transposer service, or ±5% for other applications.

COOLING

Anode: forced air

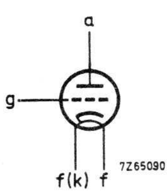
W_a (W)	t_i (°C)	q_{min} (m^3/min)	p_i (mm H_2O)
900	25	1,5	31

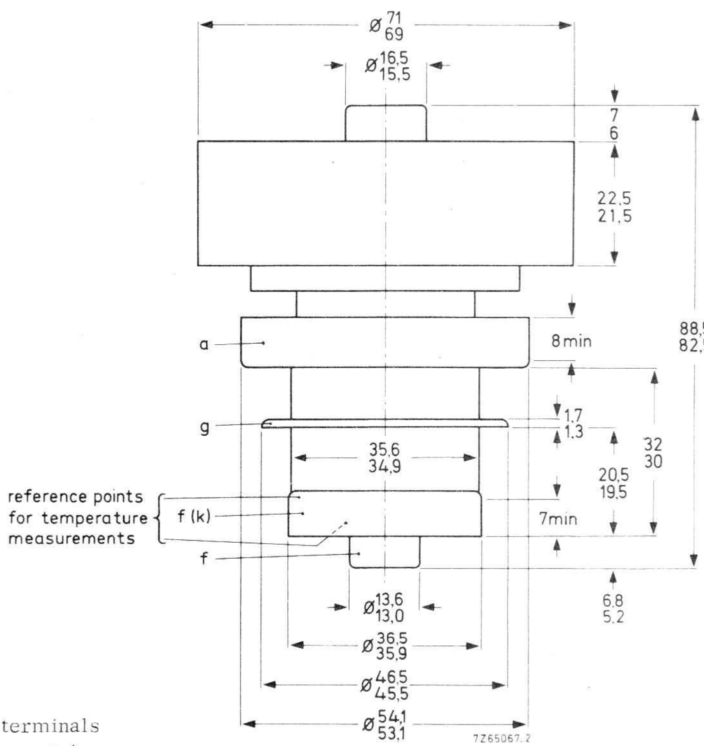
Other terminals: low velocity airflow.

When only the heater voltage is applied the heater and heater/cathode terminals should also be cooled.

Cooling air and voltages may be switched off simultaneously.

MECHANICAL DATA





The radiator and the terminals are situated within concentric cylinders of the following dimensions:

Radiator	72,0 dia
Anode terminal	55,1 dia
Grid terminal	47,0 dia
Heater/cathode terminal	37,0 dia
Heater terminal	14,5 dia

R.F. CLASS AB AMPLIFIER FOR TV TRANSPOSER SERVICE grounded grid

LIMITING VALUES (Absolute max. rating system)

Frequency	f	up to	1000	MHz
Anode voltage	V_a	max.	3500	V
Grid voltage	$-V_g$	max.	200	V
Anode dissipation	W_a	max.	900	W
Grid current	I_g	max.	5	mA
Cathode current	I_k	max.	550	mA

OPERATING CONDITIONS, grounded grid

Standard		CCIR-G		1) 2)
Frequency	f	470 to 860	470 to 860	MHz
Anode voltage	V_a	2500	1800	V
Grid voltage 3)	V_g	-24	-14	V
Anode current, no signal	I_a	250	330	mA
Anode current at zero dB level (vision carrier)	I_a	420	450	mA
Grid current	I_g	≈ 0	≈ 0	mA
Driver output power (sync)	W_{dr}	3.5	3.5	W
Output power in load (sync)	W_ℓ	110	110	W
Power gain	G	16	16	dB
Intermodulation products 4)	d	-58	-56	dB
		< -56	< -54	dB

1) Negative modulation, positive synchronization, combined sound and vision.

2) R.F. driving power should be applied after the heater and electrode voltages.

3) To be adjusted for the stated no-signal anode current. Range values for equipment design : -10 to -40 V, -5 to -35 V respectively.

4) Three-tone test method (vision carrier -8 dB, sound carrier -10 dB, sideband signal -16 dB with respect to peak sync level = 0 dB).

R.F. CLASS AB AMPLIFIER FOR TV SOUND SERVICE

LIMITING VALUES (Absolute max. rating system)

Frequency	f	up to	1000	MHz
Anode voltage	V_a	max.	3500	V
Grid voltage	$-V_g$	max.	200	V
Anode dissipation	W_a	max.	900	W
Grid current	I_g	max.	5	mA
Cathode current	I_k	max.	550	mA

OPERATING CONDITIONS 1)

Frequency	f	174 to 860	MHz
Anode voltage	V_a	2700	V
Grid voltage 2)	V_g	-28	V
Anode current, no signal	I_a	200	mA
Anode current	I_a	350	mA
Grid current	I_g	0	mA
Driver output power	W_{dr}	8	W
Output power in load	W_ℓ	300	W
Power gain	G	16	dB

1) R.F. driving power should be applied after the heater and electrode voltages.

2) To be adjusted for the stated no-signal anode current. Range values for equipment design -15 to -40 V. For "automatic bias" the cathode resistor range is 80 to 180 Ω.

AIR COOLED R.F. POWERTRIODE

Forced-air cooled coaxial power triode in metal-ceramic construction primarily intended for use as R.F. class AB linear broadband amplifier in TV transposer service at frequencies up to 1000 MHz.

QUICK REFERENCE DATA			
Transposer service (combined sound and vision)			
Frequency	f	470 to 860	MHz
Anode voltage	V_a	2500	V
Output power in the load (sync)	W_ℓ	110	W
Power gain	G	16,5	dB

HEATING : indirect, by a.c. (50 Hz to 400 Hz) or d.c.; oxide coated cathode.

Heater voltage	V_f	6,0 to 6,3	V ±5% [1]
Heater current	I_f	4,8 to 5,8	A
Cathode heating time	T_h	min. 180	s

CAPACITANCES

Anode to grid	C_{ag}	6,8 to 8	pF
Grid to cathode and heater	$C_{g/kf}$	20 to 30	pF
Anode to cathode and heater	$C_{a/kf}$	90 to 180	fF

TYPICAL CHARACTERISTICS

Anode voltage	V_a	2	kV
Anode current	I_a	400	mA
Transconductance	S	70	mA/V
Amplification factor	μ	90	

TEMPERATURE LIMITS

Absolute max. temperature measured at reference points	t	max. 250	°C

To obtain optimum life, this temperature should not exceed 200 °C.

[1]) The heater voltage must be adjusted between 6,0 and 6,3 V. For optimum performance (linearity) the voltage set must be maintained within ±2% for transposer service, or ±5% for other applications.

COOLING

Anode: forced air

W_a (W)	t_i (^oC)	q_{min} (m^3/min)	p_i (mm H_2O)
1000	25	0,7	2

Other terminals: low velocity air flow.
When only the heater voltage is applied, the heater and heater/cathode terminals should also be cooled.
Cooling air and voltages may be switched off simultaneously.

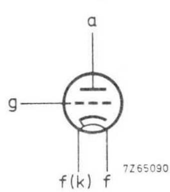
MECHANICAL DATA

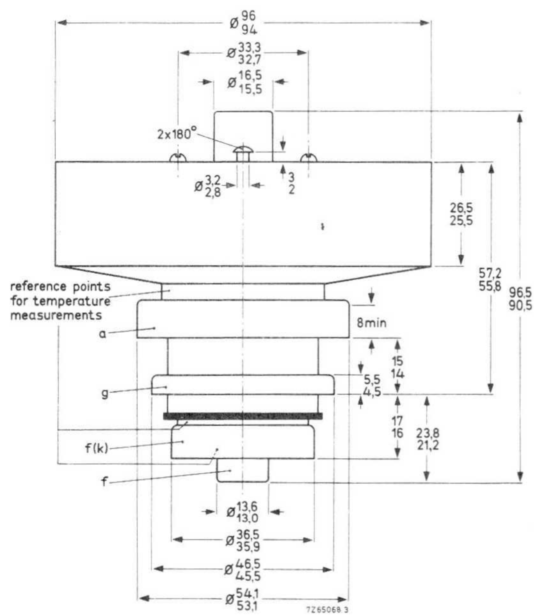
Dimensions in mm

Net mass: approx. 1000 g

Mounting position: any

Accessories:
Band IV and V amplifier circuit assembly type 40771





The radiator and the terminals are situated within concentric cylinders of the following dimensions:

Radiator	97,0 dia
Anode terminal	55,1 dia
Grid terminal	47,0 dia
Heater/cathode terminal	37,0 dia
Heater terminal	14,5 dia

R.F. CLASS AB AMPLIFIER FOR TV TRANSPOSER SERVICE grounded grid

LIMITING VALUES (Absolute max. rating system)

INDUSTRIAL R.F. TRIODE

Triodes in metal-ceramic construction intended for use as industrial oscillators.
The YD1342 has an integral water cooler.
The YD1343 is vapour cooled.

QUICK REFERENCE DATA

Oscillator output power ($W_o - W_{feedb}$)	W_{osc}		480	kW
Frequency for full ratings	f	max.	30	MHz

To be read in conjunction with "General Recommendations Transmitting Tubes for Communication, Tubes for R.F. Heating".

R.F. CLASS C OSCILLATOR FOR INDUSTRIAL USE

OPERATING CONDITIONS

Frequency	f	30	MHz
Oscillator output power ($W_o - W_{feedb}$)	W_{osc}	480	kW
Anode voltage	V_a	16	kV
Anode current	I_a	42	A
Anode input power	W_{ia}	672	kW
Anode dissipation	W_a	183	kW
Anode output power	W_o	489	kW
Anode efficiency	η_a	73	%
Oscillator efficiency	η_{osc}	71,5	%
Feedback ratio	V_{gp}/V_{ap}	9,3	%
Grid resistor	R_g	100	Ω
Grid current, on load	I_g	7,5	A
Grid voltage, negative	$-V_g$	750	V
Grid dissipation	W_g	3,4	kW
Grid resistor dissipation	W_{Rg}	5,6	kW

LIMITING VALUES (Absolute max. rating system)

Frequency for full ratings	f	up to	30	MHz
Anode voltage	V_a	max.	19,5	kV
Anode current	I_a	max.	45	A
Anode input power	W_{ia}	max.	750	kW
Anode dissipation	W_a	max.	240	kW
Grid voltage	$-V_g$	max.	2,5	kV
Grid current, on load	I_g	max.	9	A
off load	I_g	max.	11	A
Grid dissipation	W_g	max.	6	kW
Grid circuit resistance	R_g	max.	10	kΩ
Cathode current, mean	I_k	max.	55	A
peak	I_{kp}	max.	250	A
Envelope temperature	t_{env}	max.	240	^oC

HEATING : direct; thoriated tungsten filament, mesh construction

Filament voltage	V_f		14	V
Filament current	I_f		555	A
Peak filament starting current	I_{fp}	max.	3500	A
Cold filament resistance	R_{fo}		2,6	mΩ
Waiting time	T_w	min.	5	s

The filament is designed to accept temporary fluctuations of +5% and - 10%.

It is extremely important that the filament be properly decoupled. This should be so done that the resonance of the circuit formed by the filament and decoupling elements remains below the fundamental oscillator frequency. In grounded-grid circuits this resonance should be below the grid-cathode resonance. For further information please see Application Book "Tubes for R.F. heating" or contact the manufacturer.

CAPACITANCES

Anode to filament	C_{af}	3,9	pF
Grid to filament	C_{gf}	225	pF
Anode to grid	C_{ag}	70	pF

CHARACTERISTICS measured at V_a = 16 kV, I_a = 18 A

Transconductance	S	230	mA/V
Amplification factor	μ	35	

COOLING

To obtain optimum life, the temperature of the seals and of the envelope should, under normal operating conditions, be kept below 200 °C.

At low frequencies the seals are sufficiently cooled if the filament connectors are water-cooled by a flow of about 1 ℓ/min. At high frequencies, however, an additional airflow of about 6 m^3/min must be led along the seals from a 60 mm diameter nozzle positioned at a distance of 300 mm from the tube header.

YD1342

Anode + grid dissipation $W_a + W_g$ (kW)	Inlet temperature t_i (°C)	Rate of flow q_{min} (ℓ/min)	Pressure drop p_i (kPa *)	Outlet temperature t_o (°C)

WATER-COOLED MAGNETICALLY BEAMED INDUSTRIAL R.F. TRIODE

Water-cooled magnetically focused triode of metal-ceramic construction with integral water jacket intended for use as industrial oscillator.

QUICK REFERENCE DATA				
Oscillator output power ($W_o - W_{feedb}$), typical	W_{osc}		3	kW
Frequency for full ratings	f	max.	5	MHz

To be read in conjunction with "General Operational Recommendations Transmitting Tubes for Communication, Tubes for R. F. Heating".

R.F. CLASS C OSCILLATOR FOR INDUSTRIAL USE

Anode voltage single phase, full-wave rectified, unfiltered

OPERATING CONDITIONS

Frequency	f	5	MHz
Oscillator output power ($W_o - W_{feedb}$)	W_{osc}	3094	W
Transformer voltage	$V_{tr\ rms}$	5000	V
Anode voltage, mean	V_a	4500	V
Anode current, mean	I_a	720	mA
Anode input power	W_{ia}	4000	W
Anode dissipation	W_a	900	W
Anode output power	W_o	3100	W
Anode efficiency	η_a	78	%
Oscillator efficiency	η_{osc}	77,4	%
Feedback ratio	V_{gp}/V_{ap}	33	%
Grid resistor	R_g	80	kΩ
Grid current, on load	I_g	4,5	mA
off load	I_g	9,0	mA
Grid voltage, negative	$-V_g$	360	V[1]
Grid dissipation	W_g	4,4	W
Grid resistor dissipation	W_{Rg}	1,6	W

1) Max. −565 V.

LIMITING VALUES (Absolute max. rating system)

Frequency for full ratings	f	max.	5	MHz
Anode voltage, mean	V_a	max.	4500	V
Anode current, mean	I_a	max.	725	mA
Anode input power	W_{ia}	max.	4	kW
Anode dissipation	W_a	max.	2	kW
Grid voltage	V_g	max.	2400	V
Grid current	I_g	max.		see 1)
Grid dissipation	W_g	max.	25	W
Grid circuit resistance	R_g	max.	88	kΩ
Cathode current, mean	I_k	max.	730	mA
Seal temperature	t	max.	200	^{o}C

HEATING : indirect; nickel-oxide cathode, dispenser type

Heater voltage	V_f	5	V
Heater current	I_f	6, 1	A
Waiting time	T_w min.	2	min.

The filament is designed to accept temporary fluctuations of +10 % and −10 %.

CAPACITANCES

Anode to cathode	C_{ak}	0, 3	pF
Grid to cathode	C_{gk}	9, 8	pF
Anode to grid	C_{ag}	11, 5	pF

CHARACTERISTICS measured at V_a = 3 kV, I_a = 500 mA

Transconductance	S		4	mA/V
Amplification factor	μ		25	
Magnetic flux density	B	min.	115	mT
			(= 1150	Gs)

Care should be taken that the magnetic flux density is not influenced by external magnetic materials.

1) Limited by W_g max. and I_k max.

COOLING

Anode + grid dissipation $W_a + W_g$ (kW)	Inlet temperature t_i (^oC)	Rate of flow q min (ℓ/min)	Pressure drop p_i (kPa *)
2	20	3,8	31
	50	5,7	62

The water flow must be maintained for at least 1 minute after anode power is removed. Additional air cooling of the seals may be necessary to keep the temperature below the limiting value. The direction of the water flow must be such that the inflow is below the outlet for either of the two vertical mounting positions.

ACCESSORIES

460	400	17				
66,7/200					300	7
153/460					300	5,5

HEATING: direct by a.c. or d.c.; oxide coated filament

Filament voltage	V_f	max	1,6 V
Filament current at V_f = 1,6 V	I_f		4 A
Heating time for W_o = 70% of full output power	T_h	<	0,5 s

The filament has been designed to accept temporary variations in supply voltage of –25%.
The frequency of the a.c. filament supply may be

for sinusoidal supply voltages		max	200 Hz
for square wave supply voltages	any		

CAPACITANCES in push-pull connection

Input capacitance	C_i	4 pF
Output capacitance	C_o	1,5 pF

The tube is internally neutralized

TYPICAL CHARACTERISTICS (each system)

Filament voltage	V_f	=	1.4	V
Anode voltage	V_a	=	300	V
Grid No.2 voltage	V_{g_2}	=	250	V
Anode current	I_a	=	40	mA
Mutual conductance	S	=	4.0	mA/V
Amplification factor	$\mu_{g_2g_1}$	=	9	

TEMPERATURE LIMITS (Absolute limits)

Bulb and anode seal temperature	=	max.	250	^oC
Base seal temperature	=	max.	180	^oC

Anode connectors providing a high degree of heat transfer by radiation or conduction should be used

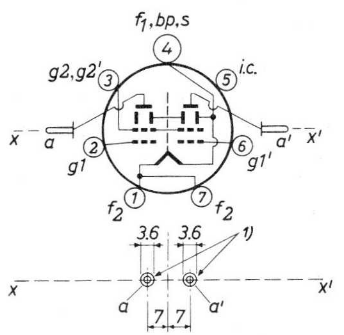
MECHANICAL DATA Dimensions in mm

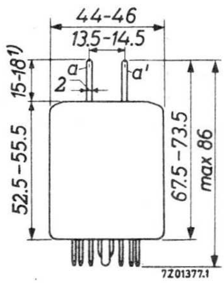
Net weight 50 g

Base : Septar

Socket : 2422 513 00001

Anode connector : 40623





Mounting position: any

If the tube is mounted with its main axis horizontally it is recommended that the plane of the anodes be vertical

Contacts 1 and 7 should be strapped together externally to reduce the effective contact resistance

1) Location of the anode pins within these circles.

R.F. CLASS C TELEGRAPHY OR F.M. TELEPHONY. Two systems in push-pull intermittent mobile service

QUICK-HEATING R.F. DOUBLE TETRODE

Quick-heating, radiation and convection cooled double tetrode for use as r.f. power amplifier or frequency multiplier in mobile transmitters.

QUICK REFERENCE DATA

freq. (MHz)	R.F. class-C telegr.		R.F. class-C ag_2 mod.		frequency multiplier	
	CCS W_ℓ (W)	ICAS W_ℓ (W)	CCS W_ℓ (W)	ICAS W_ℓ (W)	CCS W_ℓ (W)	ICAS W_ℓ (W)
180	45	75	32	53		
50/150					16	
157/470						12

HEATING: direct by a.c. or d.c.; oxide coated filament

Filament voltage	V_f		2,1 V
Filament current	I_f		4,5 A
Heating time for W_o = 70% of full output power	T_h	<	0,5 s
The frequency of the a.c. filament supply may be			
with sinusoidal supply voltages		max	200 Hz
with square-wave supply voltages	any		

The filament has been designed to accept temporary fluctuations of supply voltage of ± 15%.

CAPACITANCES in push-pull connection

Input capacitance	C_i	6 pF
Output capacitance	C_o	2 pF

TYPICAL CHARACTERISTICS; each section

Anode voltage	V_a	600 V
Grid 2 voltage	V_{g2}	250 V
Anode current	I_a	40 mA
Mutual conductance	S	4,5 mA/V
Amplification factor	μ_{g2g1}	8

TEMPERATURE LIMITS (Absolute limits)

Bulb temperature	=	max. 250 °C
Temperature of all seals	=	max. 250 °C
Pin temperature	=	max. 180 °C

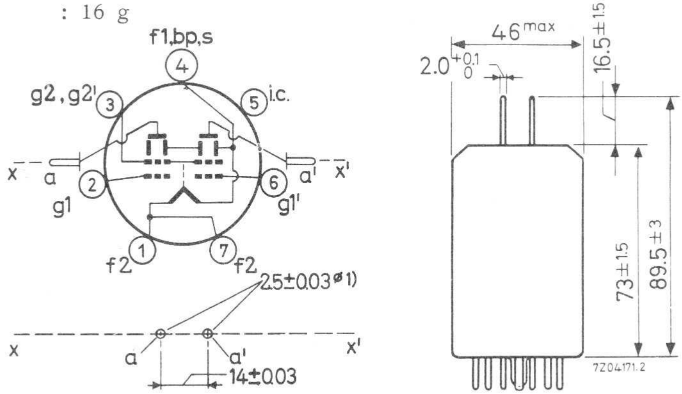
COOLING

Radiation and convection
Anode connectors providing a high degree of heat transfer by radiation or conduction should be used.

MECHANICAL DATA

Dimensions in mm

Base	: Septar
Socket	: 2422 513 00001
Anode connector	: 40623
Net weight	: 16 g



Mounting position: any

Contacts 1 and 7 should be strapped together externally to reduce the effective contact resistance.

1) Location of anode pins within these circles.

DOUBLE TETRODES

Double tetrodes for use as linear single side band amplifier.

The YL1071 is electrically identical to the YL1070 except for the heater, and has been designed to fit into heatsink cooling equipment.

QUICK REFERENCE DATA				
	AB1 linear S.S.B. amplifier, sections in parallel			
Freq. (MHz)	C.C.S.		I.C.A.S.	
	V_a (V)	W_{oPEP} (W)	V_a (V)	W_{oPEP} (W)
7	1000	141	1000	158

HEATING:

Indirect by A.C. or D.C.; parallel supply; oxide coated cathode

		Pins	5-(1+7)	1-7	
YL1070:	Heater voltage	V_f =	6.3	12.6	V
	Heater current	I_f =	1.8	0.9	A
YL1071:	Heater voltage	V_f =	13.25	26.5	V
	Heater current	I_f =	0.866	0.433	A

CAPACITANCES (each section)

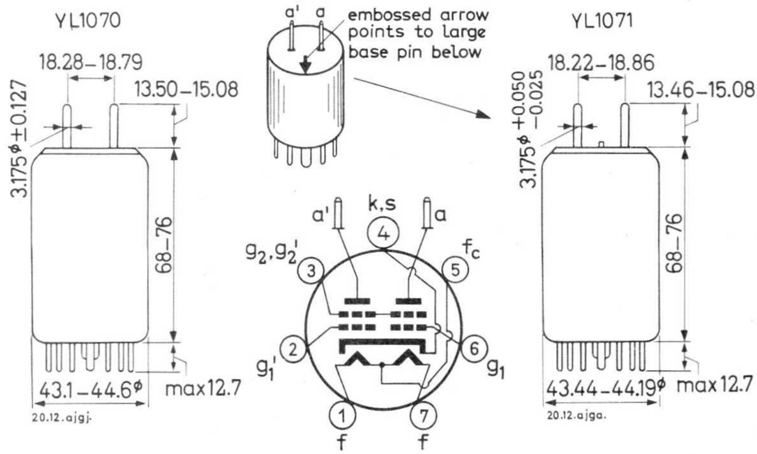
Anode to all other elements except grid No.1	C_a	=	3.15	pF
Grid No.1 to all other elements except anode	C_{g_1}	=	10.6	pF
Anode to grid No.1	C_{ag_1}	<	0.09	pF

TYPICAL CHARACTERISTICS (each section)

Anode voltage	V_a	=	600	V
Grid No.2 voltage	V_{g_2}	=	250	V
Anode current	I_a	=	40	mA
Amplification factor of grid No.2 with respect to grid No.1	$\mu_{g_2g_1}$	=	7	

MECHANICAL DATA

Dimensions in mm



Base:	Septar	
Accessories:	Anode connector	40681
	Socket	2422 513 00001
Mounting position:	Vertical with base up or down Horizontal with anode pins in a horizontal plane	
Net weight:	70 g	

COOLING: Radiation and convection

When the tube is used at maximum permissible values it may be necessary to direct an air flow of approx. 0.6 m^3/min to the bulb and to the anode seals. The YL1071 has a calibrated bulb held to close tolerances. This permits an accurate fit into heatsink cooling equipment. 7Z2 8844

TEMPERATURE LIMITS (Absolute limits)

Temperature of bulb and all seals max. 250 °C

COAXIAL BEAM POWER TETRODES

Beam power tetrodes with ceramic-to-metal seals and coaxial arrangement of the terminals. The tubes are intended for use as R.F. power amplifier, oscillator and frequency multiplier, and as A.F. amplifier and modulator in A.M., F.M. and S.S.B. transmitters for frequencies up to 2000 MHz.

QUICK REFERENCE DATA

Frequency (MHz)	C telegr.		C ag_2 mod.		S.S.B.	
	V_a (V)	W_o (W)	V_a (V)	W_o (W)	V_a (V)	W_o (W) [1]
1200	900	40				
400	900	80	700	45		
60					850	40

COOLING

Forced air cooling of radiator and seals.

HEATING : indirect by a.c. or d.c.; oxide coated cathode.

YL1100

Heater voltage	V_f		26,5	V
Heater current	I_f		0,52	A
Heating time	T_h	min.	60	s

YL1101

Heater voltage	V_f		6,3	V
Heater current	I_f		2,1	A
Heating time	T_h	min.	60	s

The heater voltage must be reduced dependent on the operating conditions and the frequency.

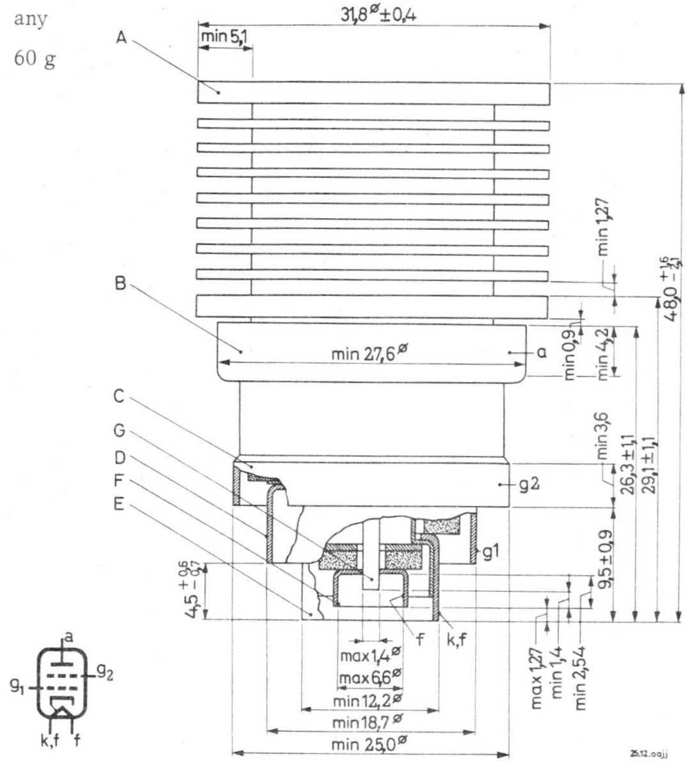
[1]) single tone operation

MECHANICAL DATA

Dimensions in mm

Mounting position : any

Net weight : 60 g



Radiator and terminals lie inside or outside concentric cylinders with the following diameters:

Radiator	:	A	inside	24, 15	mm diameter
Anode terminal	:	B	inside	28, 40	mm diameter
g_2 terminal	:	C	inside	25, 86	mm diameter
g_1 terminal	:	D	inside	19, 38	mm diameter

[1]) To be adjusted for zero signal anode current.

[2]) Maximum values encountered at any level of drive voltage referred to the amplitude of either of the two equal tones at that level.
Relative to the peak envelope power these figures will be increased by 6 dB.
Considerably better distortion figures can be achieved with I_a at zero signal = 0.8 A at the cost of higher zero signal anode dissipation. Efficiency for full drive is hardly deteriorated by this higher value of zero signal anode current.

QUICK-HEATING R.F. DOUBLE TETRODE

Quick-heating radiation and convection cooled double tetrode for use as r.f. amplifier and frequency multiplier up to 500 MHz, designed for intermittent filament operation in transistorized mobile transmitters.

QUICK REFERENCE DATA

freq. MHz	R.F. class C telegraphy			R.F. class C frequency multiplier		
	V_a V	W_{dr} * W	W_ℓ W	V_a V	W_{dr} * W	W_ℓ W
200	275	0,7	12,5			
500	175	1,5	6,0			
167/500				175	1,5	2,0

HEATING: direct by a.c. or d.c. series or parallel supply; oxide coated filament

Filament voltage	V_f		1,1 V
Filament current	I_f		2,9 A
Heating time for W_o = 70% of full output power	T_h	<	0,5 s

The filament has been designed to accept temporary fluctuations of supply voltage of ± 15%.

The frequency of the a.c. filament supply may be

for sinusoidal supply voltage		max	200 Hz
for square wave supply voltage	any		

CAPACITANCES in push-pull connection

Input capacitance	C_i	4,1 pF
Output capacitance	C_o	1,2 pF

* Driver output power.

TYPICAL CHARACTERISTICS

Anode voltage	V_a	=	175	V
Grid No.2 voltage	V_{g_2}	=	175	V
Anode current	I_a	=	40	mA
Amplification factor	$\mu_{g_2g_1}$	=	22	
Mutual conductance	S	=	7	mA/V

COOLING: Radiation and convection

The use of a closed tube shield is not recommended

TEMPERATURE LIMITS (Absolute limits)

Bulb temperature = max. 230 °C

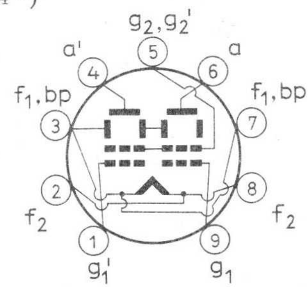
MECHANICAL DATA

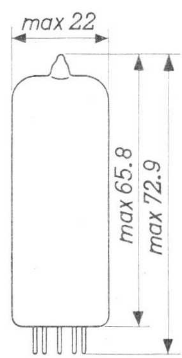
Dimensions in mm

Base : Noval

Socket : 2422 502 01004 [1])

Net weight: 16 g





Mounting position: any

If the tube is mounted with its main axis horizontally, it is recommended that the pins 3 and 7 be in a horizontal plane.

The filament connections (tags 3-7 and 2-8) should be connected in parallel on the socket.

---

[1]) Or equivalent type suitable for the high filament current

R.F. CLASS C TELEGRAPHY OR F.M. TELEPHONY; two systems in push-pull

R.F. POWER TETRODES

Power tetrodes in metal-glass construction intended for use as s.s.b. amplifier and class-B amplifier in TV transmitters. The YL1181 is forced air cooled. The YL1182 is vapour cooled.

QUICK REFERENCE DATA

R.F. class-AB amplifier, single-sideband

Frequency	f	30	MHz
Anode voltage	V_a	4,5	kV
Output power (P.E.P.)	W_ℓ	3	kW

R.F. class-B amplifier for TV service

Frequency	f	230	MHz
Anode voltage	V_a	4	kV
Output power (sync)	W_ℓ	5,5	kW

HEATING: direct; thoriated tungsten filament

Filament voltage	V_f	5	V
Filament current	I_f	64	A

CAPACITANCES

Anode to all except grid 1	$C_{a(g1)}$	14	pF
Grid 1 to all except anode	$C_{g1(a)}$	78	pF
Anode to grid 1	C_{ag1}	0,23	pF

TYPICAL CHARACTERISTICS

Anode voltage	V_a	3	kV
Grid 2 voltage	V_{g2}	600	V
Anode current	I_a	1	A
Transconductance	S	22	mA/V
Amplification factor	μ_{g2g1}	5,2	

TEMPERATURE LIMITS AND COOLING

YL1181

Absolute maximum envelope temperature t_{env} max 220 °C

Required quantity of air

W_a kW	h m	t_i °C	q m^3/min	p_i Pa *
2,5	0	25	2,7	500
4	0	25	4,3	1300

See also cooling curve Fig. 1.

A low velocity air flow (> 0,5 m^3/min) should be directed to the filament and grid seals.

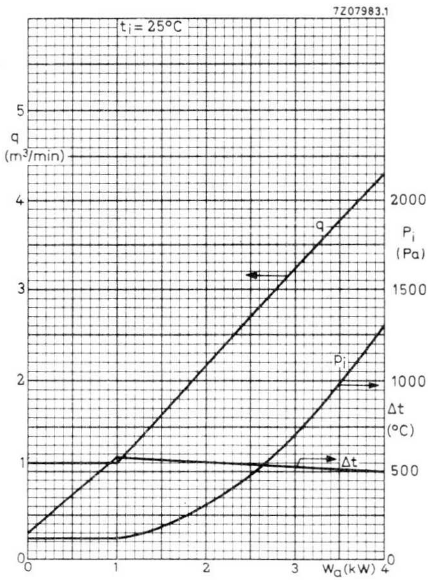

Fig. 1

* 10 Pa ≈ 1 mm H_2O.

YL1182

Absolute maximum envelope temperature t_{env} max 220 °C

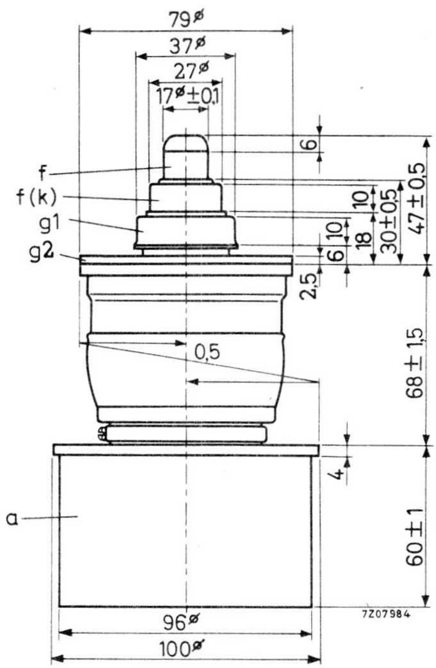
A low velocity air flow (> 0,5 m^3/min) should be directed to the filament and grid seals.

MECHANICAL DATA Dimensions in mm

YL1181

Net mass: ≈ 2,5 kg

Mounting position: Vertical with anode up or down



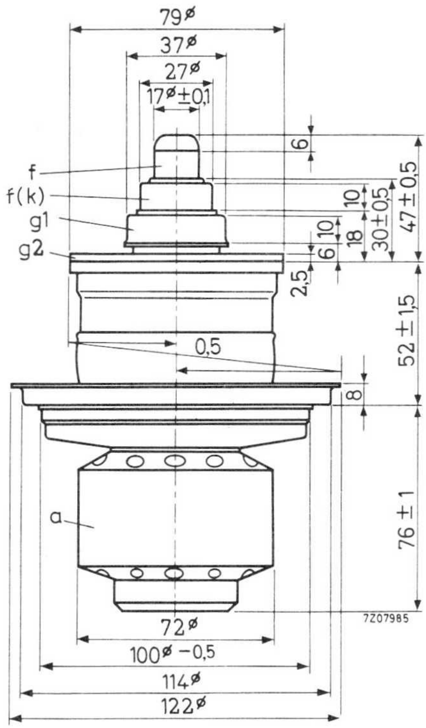
ACCESSORIES

Filament connector (1 required)	type 40721
Grid 1 connector	type 40722
Grid 2 connector	type 40723
Insulating pedestal	type 40724

YL1182

Net mass: ≈ 1,7 kg

Mounting position: Vertical with anode down



ACCESSORIES

Filament connector (1 required)	type 40721
Grid 1 connector	type 40722
Grid 2 connector	type 40723
Boiler	type K731

R.F. CLASS-AB LINEAR AMPLIFIER, SINGLE-SIDEBAND, suppressed carrier

LIMITING VALUES (Absolute maximum rating system)

QUICK-HEATING R.F. DOUBLE TETRODE

Radiation and convection cooled double tetrode intended for use as r.f. amplifier and frequency multiplier up to 500 MHz, designed for intermittent filament operation in transistorized mobile transmitters.

QUICK REFERENCE DATA

R.F. class-C telegraphy	f	200 MHz	V_a	350 V
	W_{dr}	1,0 W	W_ℓ	26 W
R.F. class-C telegraphy	f	500 MHz	V_a	250 V
	W_{dr}	2,5 W	W_ℓ	14,5 W
R.F. class-C frequency multiplier	f	167/500 MHz	V_a	250 V
	W_{dr}	2,2 W	W_ℓ	2,5 W
R.F. class-C ag_2 mod.	f	175 MHz	V_a	280 V
	W_{dr}	1,5 W	W_ℓ	15 W

HEATING: direct by a.c. or d.c., series or parallel supply; oxide coated filament.

Filament voltage	V_f		1,1 V
Filament current	I_f		4,2 A
Heating time for W_o = 70% of full output power	T_h	<	0,5 s

The filament has been designed to accept temporary fluctuations of supply voltage of ± 15%.

The frequency of the a.c. filament supply may be

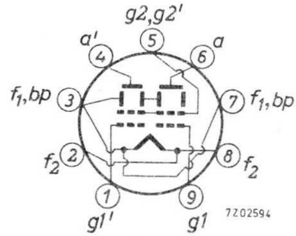
for sinusoidal supply voltage		max	200 Hz
for square wave supply voltage	any		

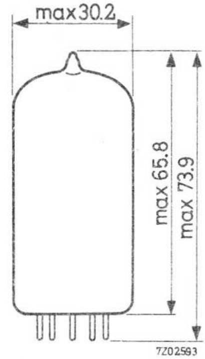
CAPACITANCES in push-pull connection

Input	C_i	4,7 pF
Output	C_o	1,2 pF

DIMENSIONS AND CONNECTIONS

Base: Magnoval





TYPICAL CHARACTERISTICS, each unit

Amplification factor			
at V_a = 150 V, V_{g2} = 150 V, I_a = 45 mA	$\mu_{g_2g_1}$	20	
Transconductance			
at V_a = 150 V, V_{g2} = 150 V, I_a = 45 mA	S	9.5	mA/V

MOUNTING POSITION any

If the tube is mounted with its main axis horizontally it is recommended that the pins 3 and 7 be in a horizontal plane.

ACCESSORIES

Socket: magnoval 2422 502 05001 or equivalent type suitable for the high filament current.
Filament connections (tags 3-7 and 2-8) should be connected in parallel on the socket.

WEIGHT

Net weight 27 g

TEMPERATURE LIMITS AND COOLING

Radiation and convection cooling. The use of a closed tube shield is not recommended.

Absolute maximum bulb temperature t_{bulb} max. 230 °C

R.F. CLASS C TELEGRAPHY AND F.M. TELEPHONY, two units in push-pull

CHARACTERISTICS AND RANGE VALUES (continued)

Insulation between the electrodes

A leakage current of 10 μA is not exceeded when the following voltages, with polarity as indicated are applied to the indicated electrodes via a series resistor of 10 MΩ

			I	II	III	
Grid No.1 (-) to grids No.2 and 3 and anode (+)	$V_{g_1(-)/a,g_2,g_3(+)}$	=	1000		550	V
Grid No.2 (+) to grid No.3 (-)	$V_{g_2(+)/g_3(-)}$	=	1000		550	V
Anode (+) to grid No.3 (-)	$V_{a(+)/g_3(-)}$	=	3000		1200	V
Cathode (+) to grid No.1 (-)	$V_{k(+)/g_1(-)}$	=	200		150	V

LIFE EXPECTANCY

3000 hours under the following conditions:

Heater voltage	V_f	=	12.6	V
Anode voltage	V_a	=	100	V
Grid No.3 voltage	V_{g_3}	=	0	V
Grid No.2 voltage	V_{g_2}	=	250	V
Grid No.1 voltage	V_{g_1}	=	-20	V
Grid No.1 pulse voltage (pulse substantially square)	$V_{g_{1p}}$	=	40	V
Pulse repetition frequency	f_{imp}	=	80	Hz
Pulse duration	T_{imp}	=	8	ms

AGEING

In order to detect "early failures" and to ensure that the tubes are properly stabilised, all tubes are aged prior to testing during 200 hours under the following conditions:

Heater voltage	V_f	=	12.6	V
Anode current	I_a	=	70	mA
Anode dissipation	W_a	=	20	W
Peak anode voltage	V_{ap}	=	515	V

STAND-BY PERFORMANCE [1])

After 200 hours of operation with V_f = 14 V only, the tubes are criticised for

Cathode interface resistance >10 Ω (continuous wave method IEC Publ. 151-9, two frequency method)

LIFE PERFORMANCE [1])

After 3000 hours of operation under the following conditions

Heater voltage	V_f	=	12.6	V
Anode voltage	V_a	=	100	V
Grid No.3 voltage	V_{g_3}	=	0	V
Grid No.2 voltage	V_{g_2}	=	250	V
Grid No.1 voltage	V_{g_1}	=	-20	V
Grid No.1 pulse voltage (pulse substantially square)	$V_{g_{1p}}$	=	40	V
Pulse repetition frequency	f_{imp}	=	80	Hz
Pulse duration	T_{imp}	=	8	ms

the tubes are critised for

Inoperatives

Control grid voltage for cut-off
Control grid current
Leakage current

} See section "Characteristics and range values".

[1]) This test is performed on a sample taken from each production run.

VIBRATIONAL NOISE OUTPUT [1][2]

Conditions:

Anode voltage	V_a	=	100	V
Grid No. 2 voltage	V_{g_2}	=	150	V
Grid No. 3 voltage	V_{g_3}	=	0	V
Anode current	I_a	=	10	mA
Vibrational acceleration		=	10	g
Duration	T	=	60	sec in each of the three directions X_1, X_2 and Y
Frequency	f	=	25	Hz
Anode load resistance	R_a	=	2	kΩ

Limit of the vibrational noise output V_{noise} = max. 750 mV(RMS)

FATIGUE : 2.5 g [1][2]

Vibrational forces for a period of 32 hours at a frequency of 50 Hz in each of the three directions X_1, X_2 and Y

VIBRATION: 5 g [1][2]

Vibrational forces for a period of 2 hours at a frequency of 25 Hz in each of the three directions X_1, X_2 and Y

---

[1]) This test is performed on a sample taken from each production run.

[2]) These test conditions are only given for evaluation of the ruggedness of the tube and should by no means be interpreted as suitable operating conditions. Fatigue and vibration are destructive tests.

AIR COOLED R.F. POWER TETRODE

Forced air cooled beam power tetrode in ceramic-metal construction intended for use in Class AB audio or R.F. amplifier service.

HEATING: Indirect; oxide coated cathode

Heater voltage	V_f		26.5	V
Heater current	I_f		730	mA
Waiting time	T_w	min.	30	s

For further data please refer to type YL1340

Available for equipment maintenance. No longer recommended for equipment production.

R.F. DOUBLE TETRODE

HEATING: indirect; oxide coated cathode

Heater voltage	13,5 V
Heater current	280 mA
Pin connections	1 - 8

For further data and curves of this type
please refer to type QQE04/5

Available for equipment maintenance. No longer recommended for equipment production.

R.F. BEAM POWER TETRODE

R.F. beam power tetrode intended for use as r.f. power amplifier, oscillator, a.f. power amplifier and modulator in both mobile and fixed equipment.

Notes pages 3 through 9

1. For operation at maximum ratings.
   For operation at less than maximum ratings:
   R_{g_1} = max. 100 kΩ.
2. Obtained preferably from a separate source, or from the anode supply voltage with a voltage divider, or through a series resistor.
   A series resistor should be used only when the tube is used in a circuit which is not keyed. Grid No.2 voltage must not exceed 435 V under key-up conditions.
3. V_{g_1} may be obtained from a separate supply, or from R_{g_1} or R_k, or by combination methods.
4. Obtained preferably from a separate source modulated with the anode supply, or from the anode supply through a series resistor.
5. Obtained from a separate source.
6. Maximum values encountered at any level of drive voltage up to full drive referred to the amplitude of either of the two equal tones at that level.
7. Obtained preferably from a separate source or from the anode voltage supply with a voltage divider.

SPECIAL PERFORMANCE DATA

Stationary equipment operation

		min.	nom.	max.	
Heater voltage	V_f	-	6.3	-	V 1)
Heater current at V_f = 6.3 V	I_f	1050	-	1200	mA
Grid No.2 current	I_{g2}	-	-	15	mA 2)
Output power in load	W_ℓ	59	-	-	W 2)

Mobile equipment operation

		min.	design range	max.	
Heater voltage	V_f	-	6.0 to 7.5	-	V 3)
Heater current at V_f = 6.75 V	I_f	1100	-	1230	mA
Grid No.2 current	I_{g2}	-	-	15	mA 2)
Output power in load	W_ℓ	59			W 2)
Decrease output power in load	ΔW_ℓ			10	% 4)

Notes

1. Recommended design centre heater voltage 6.3 V. To ensure long life the heater voltage should not fluctuate more than 10%.

2. In a self-excited oscillator circuit and

Heater voltage	V_f	6.3	V
Anode voltage	V_a	600	V
Grid No.2 voltage	V_{g2}	200	V
Grid No.1 resistor	R_{g1}	24	kΩ ±10%
Anode current	I_a	max. 150	mA
Grid No.1 current	I_{g1}	2.5 to 3	mA
Frequency	f	15	MHz

3. Recommended heater voltage within the range V_f 6.0 to 7.5 V
   In battery operation within the range V_f 5.0 to 8.0 V

4. With the conditions of note 2, reduce the heater voltage to 5.0 V. The decrease in output power ΔW_ℓ = max. 10%.

Over voltage heater life tests

Continuous heater life tests are performed periodically on sample lots of tubes with 8 V on the heater, all electrodes floating.

Intermittent heater life tests are performed periodically on sample lots of tubes with 11 V on the heater, a cycle of 1 minute "on" and 4 minutes "off".
After 1000 h of continuous heater life test, and after 48 h of entermittent life test the following measurements are performed:

Cathode to heater leakage at $V_f = 6.75$ V; $V_{kf} = \pm 100$ V	I_{kf}	max.	100	μA
Leakage resistance grid No.1 at $V_f = 6.75$ V; $V_{g1} = -200$ V; $V_a = V_{g2} = V_k = 0$ V	r_{ins}	min.	10	MΩ
Leakage resistance anode at $V_f = 6.75$ V; $V_a = -200$ V V_{g_2}, V_{g_1}, $V_k = 0$ V	r_{ins}	min.	10	MΩ

R.F. BEAM POWER TETRODE

R.F. beam power tetrode intended for use as r.f. power amplifier, oscillator, a.f. power amplifier and modulator in both mobile and fixed equipment.

HEATING: indirect by a.c. or d.c.; oxide coated cathode.

Heater voltage	V_f		12,6	V
Heater current	I_f		562	mA
Cathode heating time	T_h	min	60	s

CAPACITANCES

Grid 1 to all except anode	$C_{g1(a)}$		13	pF
Anode to all except grid 1	$C_{a(g1)}$		8,5	pF
Anode to grid 1	C_{ag1}	max	0,24	pF

SPECIAL PERFORMANCE DATA

STATIONARY EQUIPMENT OPERATION		min	nom	max	
Heater voltage	V_f	–	12,6	–	V note 1
Heater current at V_f = 12,6 V	I_f	525	–	600	mA
Output power in load	W_ℓ	59	–	–	W note 2

MOBILE EQUIPMENT OPERATION		min	design range	max	
Heater voltage	V_f	–	12 to 15	–	V note 3
Heater current at V_f = 13,5 V	I_f	550	–	620	mA
Output power in load	W_ℓ	59	–	–	W note 2
Decrease output power in load	ΔW_ℓ	–	–	10	% note 4

Notes see page 2.

NOTES

1. Recommended design centre heater voltage 12.6 V.
   To ensure long life the heater voltage should not fluctuate more than 10%.

2. In a self-excited oscillator circuit and

Heater voltage	V_f	12.6	V
Anode voltage	V_a	600	V
Grid No.2 voltage	V_{g_2}	200	V
Grid No.1 resistor	R_{g_1}	24	kΩ ±10%
Anode current	I_a	max. 150	mA
Grid No.1 current	I_{g_1}	2.5 to 3	mA
Frequency	f	15	MHz

3. Recommended heater voltage within the range 12.0 to 15.0 V.
   In battery operation within the range 10 to 15 V.

4. With the conditions of note 2, reduce the heater voltage to 10 V. The decrease in output power ΔW_ℓ = max. 10%.

Overvoltage life tests

Continuous heater life tests are performed periodically on sample lots of tubes with 16 V on the heater, all electrodes floating.

Intermittent heater life tests are performed periodically on sample lots of tubes with 22 V on the heater, a cycle of 1 minute "on" and 4 minutes "off".
After 1000 h of continuous heater life test, and after 48 h of intermittent life test the following measurements are performed:

Cathode to heater leakage at V_f = 13.5 V; V_{kf} = ± 100 V	I_{kf}	max. 100	μA
Leakage resistance grid No.1 at V_f = 13.5 V; V_{g_1} = − 200 V $V_a = V_{g_2} = V_k$ = 0 V	r_{ins}	min. 10	MΩ
Leakage resistance anode at V_f = 13.5 V; V_a = −200 V $V_{g_2} = V_{g_1} = V_k$ = 0 V	r_{ins}	min. 10	MΩ

For further data and curves please refer to type YL1370

Available for equipment maintenance. No longer recommended for equipment production.

R.F. BEAM POWER TETRODE

R.F. beam power tetrode intended for use as r.f. power amplifier, oscillator, a.f. power amplifier and modulator in both mobile and fixed equipment.

HEATING: indirect by a.c. or d.c.; oxide coated cathode.

Heater voltage	V_f		26,5	V
Heater current	I_f		300	mA
Cathode heating time	T_h	min	60	s

CAPACITANCES

Grid 1 to all except anode	$C_{g1(a)}$		13	pF
Anode to all except grid 1	$C_{a(g1)}$		8,5	pF
Anode to grid 1	C_{ag1}	min	0,24	pF

SPECIAL PERFORMANCE DATA

STATIONARY EQUIPMENT OPERATION		min	nom	max	
Heater voltage	V_f	–	26,5	–	V note 1
Heater current at V_f = 26,5 V	I_f	280	–	320	mA
Output power in load	W_ℓ	59	–	–	W note 2

MOBILE EQUIPMENT OPERATION		min	design range	max	
Heater voltage	V_f	–	24 to 29	–	V note 3
Heater current at V_f = 26,5 V	I_f	280	–	320	mA
Output power in load	W_ℓ	59	–	–	W note 2
Decrease output power in load	ΔW_ℓ	–	–	10	% note 4

Notes see page 2.

NOTES

1. Recommended design centre heater voltage 26.5 V.
   To ensure long life the heater voltage should not fluctuate more than 10%.

2. In a self excited oscillator circuit and

Heater voltage	V_f	26.5	V
Anode voltage	V_a	600	V
Grid No.2 voltage	V_{g_2}	200	V
Grid No.1 resistor	R_{g_1}	24	kΩ ± 10%
Anode current	I_a	max. 150	mA
Grid No.1 current	I_{g_1}	2.5 to 3	mA
Frequency	f	15	MHz

3. Recommended heater voltage within the range 24 to 29 V.
   In battery operation within the range 21 to 31 V.

4. With the conditions of note 2, reduce the heater voltage to 10 V. The decrease in output power ΔW_ℓ = max. 10%.

Overvoltage life tests

Continuous heater life tests are performed periodically on sample lots of tubes with 31 V on the heater, all electrodes floating.

Intermittent heater life tests are performed periodically on sample lots of tubes with 43 V on the heater, a cycle of 1 minute "on" and 4 minutes "off".
After 1000 h of continuous heater life test, and after 48 h of intermittent life test the following measurements are performed:

Cathode to heater leakage at V_f = 26.5 V; V_{kf} = ± 100 V	I_{kf}	max. 150	μA
Leakage resistance grid No.1 at V_f = 26.5 V; V_{g_1} = − 200 V $V_a = V_{g_2} = V_k$ = 0 V	r_{ins}	min. 10	MΩ
Leakage resistance anode at V_f = 26.5 V; V_a = −200 V $V_{g_2} = V_{g_1} = V_k$ = 0 V	r_{ins}	min. 10	MΩ

For further data and curves please refer to type YL1370

AIR COOLED V.H.F. POWER TETRODE

Forced air cooled coaxial power tetrode in metal-ceramic construction primarily intended for use as a linear broad-band amplifier in T V transmitters in the bands I and III. This type is also very suitable for A.M. and F.M. broadcast, A.F. modulator applications and in T V transposer service.

QUICK REFERENCE DATA			
Class AB linear amplifier (vision)			
Frequency	f	175, 25	MHz
Anode voltage	V_a	5	kV
Output power in load	W_ℓ	8, 6	kW
Power gain	G	24	
Class B amplifier			
Frequency	f	260	MHz
Anode voltage	V_a	7	kV
Output power in load	W_ℓ	10, 5	kW
Power gain	G	32	
R.F. Class C telegraphy or F.M. telephony			
Frequency	f	260	MHz
Anode voltage	V_a	7	kV
Output power in load	W_ℓ	11	kW
Power gain	G	32	
TV transposer service			
Frequency	f	175 to 225	MHz
Anode voltage	V_a	4	kV
Output power in load	W	2, 5	kW
Power gain	G	30	

HEATING: direct; filament thoriated tungsten, mesh type

Filament voltage	V_f		6, 3	V
Filament current	I_f		120	A
Filament peak starting current	I_{fp}	max.	750	A
Cold filament resistance	R_{f_o}		6	mΩ
Waiting time	T_w	min.	1	s

The filament is designed to accept temporary fluctuations of ±5%.

TYPICAL CHARACTERISTICS

Anode voltage	V_a	5	kV
Grid no. 2 voltage	V_{g2}	600	V
Anode current	I_a	1,45	A
Transconductance	S	30	mA/V
Amplification factor	μ_{g2g1}	7,5	

CAPACITANCES

	(grounded cathode)		(grounded grid)		
Input	$C_{g1(a)}$	90	$C_{f(a)}$	48	pF
Output	$C_{a(g1)}$	16	$C_{a(f)}$	16,4	pF
Anode to grid no. 1	C_{ag1}	0,55			pF
Anode to filament			C_{af}	0,15	pF

TEMPERATURE LIMITS

Absolute max. envelope temperature	t_{env}	max.	240	^oC
Recommended max. seal temperature	t	max.	200	^oC

COOLING

See curves
Direction of air flow: see drawing.

→ To obtain optimum life the temperature of the seals and of the envelope should be kept below 200 ^oC.

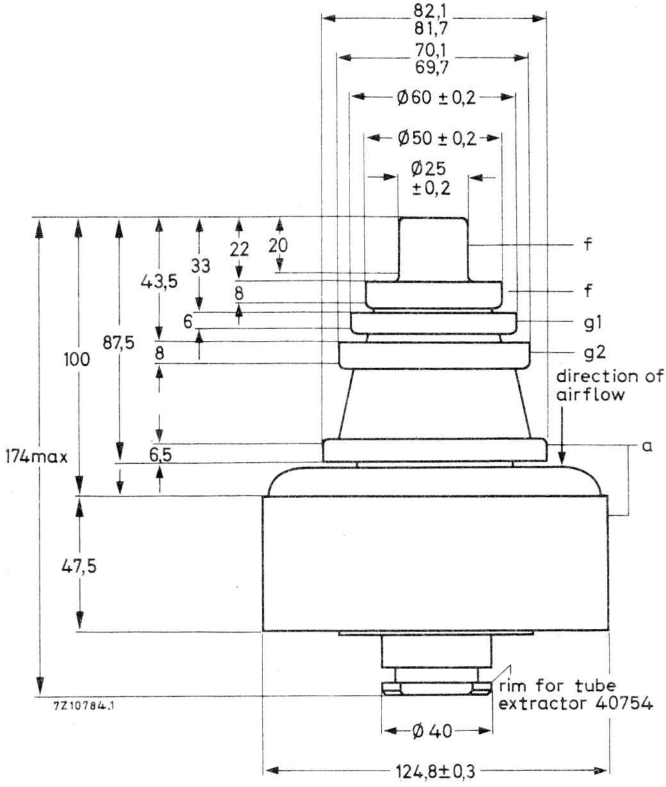
ACCESSORIES

Band I amplifier circuit assembly (vision)	type 40757
Band I amplifier circuit assembly (sound)	type 40758
Band III amplifier circuit assembly (vision)	type 40745
Band III amplifier circuit assembly (sound)	type 40746

MECHANICAL DATA

Dimensions in mm

Net weight: approx. 3,1 kg
Mounting position: Vertical with anode up or down.



R.F. CLASS B SERVICE

NOTES

1) To be adjusted for the stated no signal anode current.
2) With double tuned circuit.
3) Black signal including line sync pulses
4) A picture/sync ratio of 75/25 for the outgoing signal requires a ratio of max. 70/30 for the incoming signal in which case the sync compression sync in/out = 30/25.
5) Measured with a saw tooth amplitude, running from 17 % to 75 % of the peak sync value, with superimposed a 4, 43 MHz sine wave with a 10 % peak to peak value.
6) At c.w. output power = 2, 5 kW
7) Three-tone test method (vision carrier −8 dB, sound carrier −7 dB, sideband signal −17 dB with respect to peak sync = 0 dB).

AIR COOLED V.H.F. POWER TETRODE

Forced air cooled coaxial power tetrode in metal-ceramic construction primarily intended for use as a linear broad-band amplifier in T V transmitters in the bands I and III. This type is also very suitable for A.M. and F.M broadcast, A.F. modulator applications, and in T V transposer service.

QUICK REFERENCE DATA			
Frequency	f	175, 25	MHz
Anode voltage	V_a	7	kV
Output power in load	W_ℓ	18, 4	kW
Power gain	G	25	
Class B amplifier			
Frequency	f	260	MHz
Anode voltage	V_a	7, 5	kV
Output power in load	W_ℓ	13	kW
Power gain	G	32, 5	
R.F. Class C telegraphy or F.M. telephony			
Frequency	f	260	MHz
Anode voltage	V_a	8	kV
Output power in load	W_ℓ	18	kW
Power gain	G	30	
TV transposer service			
Frequency	f	175 to 225	MHz
Anode voltage	V_a	6	kV
Output power in load	W_ℓ	7	kW
Power gain	G	32	

HEATING : direct; filament thoriated tungsten,. mesh type.

Filament voltage	V_f		8	V
Filament current	I_f		120	A
Filament peak starting current	I_{f_p}	max.	750	A
Cold filament starting current	R_{f_o}		7, 5	mΩ
Waiting time	T_w	min.	1	s

The filament is designed to accept temporary fluctuations of ±5%.

TYPICAL CHARACTERISTICS

Anode voltage	V_a	6	kV
Grid no. 2 voltage	V_{g2}	650	V
Anode current	I_a	2,4	A
Transconductance	S	45	mA/V
Amplification factor	μ_{g2g1}	8,5	

CAPACITANCES

	grounded cathode		grounded grid		
Input	$C_{g1(a)}$	110	$C_{f(a)}$	55	pF
Output	$C_{a(g1)}$	17,5	$C_{a(f)}$	18	pF
Anode to grid no. 1	C_{ag1}	0,7			pF
Anode to filament			C_{af}	0,2	pF

TEMPERATURE LIMITS

Absolute max. envelope temperature	t_{env}	max.	240	^oC
Recommended max. seal temperature	t	max.	200	^oC

COOLING

See curves.
Direction of air flow: see drawing.

→ To obtain optimum life the temperature of the seals and of the envelope should be kept below 200 ^oC.

ACCESSORIES

Power gain	$\frac{W_\ell}{W_{dr}}$	30		

[1]) see page 9

NOTES

1) To be adjusted for the stated no signal anode current.

2) With double tuned circuit.

3) Black signal including line sync pulses.

4) A picture/sync ratio of 72/25 for the outgoing signal requires a ratio of max. 70/30 for the incoming signal in which case the sync compression sync in/out = 30/25.

5) Measured with a saw tooth amplitude, running from 17 % to 75 % of the peak sync value, with superimposed a 4, 43 MHz sine wave with a 10 % peak to peak value.

6) At c.w. output power = 7 kW

7) Three-tone test method (vision carrier −8 dB, sound carrier −7 dB, sideband signal −17 dB with respect to peak sync = 0 dB).

NOTES

1) With double tuned circuit.

2) To be adjusted for the stated no signal anode current.

3) Black signal including line sync pulses.

4) A picture/sync ratio of 75/25 for the outgoing signal requires a ratio of max. 70/30 for the incoming signal in which case the sync compression sync in/out = 30/25.

5) Measured with a saw tooth amplitude, running from 17 % to 75 % of the peak sync value, with superimposed a 4, 43 MHz sine wave with a 10 % peak to peak value.

6) At c.w. output power = 550 W

7) Three-tone test method (vision carrier −8 dB, sound carrier −7 dB, sideband signal −17 dB with respect to peak sync = 0 dB).

R.F. POWER TETRODE

Mesh-type cathode version of QB4/1100.

With this tube in centre-tapped filament transformer arrangement the hum level is reduced to better than -60 dB.

For data and curves of this type please refer to type QB4/1100.

R.F. POWER TETRODE

Mesh-type cathode version of QB4/1100GA.

With this tube in centre-tapped filament transformer arrangement the hum level is reduced to better than -60 dB.

For data and curves of this type please refer to type QB4/1100GA.

AIR COOLED V.H.F. POWER TETRODE

Forced air cooled coaxial power tetrode in metal-ceramic construction primarily intended for use as final amplifier in F.M. transmitters in band II in grounded cathode circuits.

QUICK REFERENCE DATA			
Frequency (MHz)	H.F. Class-B amplifier		
	V_a (kV)	W_ℓ (kW)	Power gain (dB)
110	6	6	23
	7	11	22

HEATING : Direct; filament thoriated tungsten, mesh type

Filament voltage	V_f	6,3	V
Filament current	I_f	120	A
Filament peak starting current	I_{f_p} max.	750	A
Cold filament resistance	R_{f_o}	6	mΩ
Waiting time	T_w min.	1	s

The filament is designed to accept temporary fluctuations of ±5%.

CAPACITANCES

Input	$C_{g_1(a)}$	87	pF
Output	$C_{a(g_1)}$	20	pF
Anode to grid no.1	C_{ag_1}	0,5	pF

TYPICAL CHARACTERISTICS

Anode voltage	V_a	5	kV
Grid no.2 voltage	V_{g2}	600	V
Anode current	I_a	1,2	A
Transconductance	S	30	mA/V
Amplification factor	μ_{g2g1}	7,2	-

TEMPERATURE LIMITS

Absolute max. envelope temperature	t_{env} max.	240	^oC
Recommended max. seal temperature	t max.	200	^oC

COOLING

To obtain optimum life the temperature of the seals and of the envelope should be kept below 200 °C.
To keep the temperature of the seals below the maximum permissible value, it may be necessary to direct an air flow to the seals.

Anode cooling: see cooling curves.

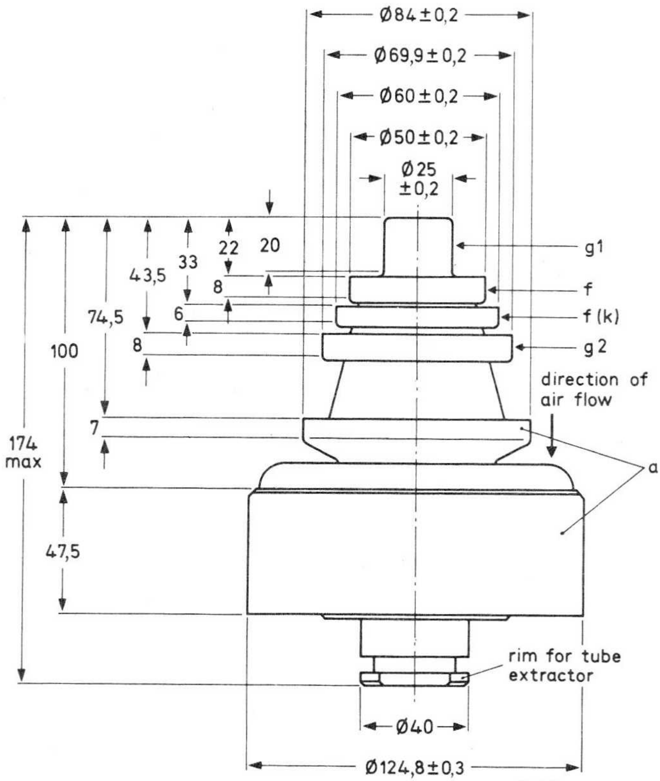
Direction of air flow: see outline drawing.

MECHANICAL DATA

Dimensions in mm

Net mass : approx. 3,1 kg

Mounting position: vertical with anode up or down.



ACCESSORIES

Band II amplifier circuit assembly type 40775

AIR COOLED V.H.F. POWER TETRODE

Forced air cooled coaxial power tetrode in metal-ceramic construction primarily intended for use as a linear broad-band amplifier in TV transmitters in the bands I and III. This type is also very suitable for A.M. and F.M. broadcast and A.F. modulator applications, and in TV transposer service.

QUICK REFERENCE DATA					
Class AB linear amplifier (vision)					
Frequency	f			175,25	MHz
Anode voltage	V_a			8	kV
Output power in load	W_ℓ			27,5	kW
Power gain	G			28,5	
Class C telegraphy or F.M. telephony					
Frequency	f			260	MHz
Anode voltage	V_a			8,5	kV
Output power in load	W_ℓ			25	kW
Power gain	G			31	
Television transposer service					
Frequency	f	175	to	225	MHz
Anode voltage	V_a			8	kV
Output power in load	W_ℓ			10,5	kW
Power gain	G			42	

HEATING : direct; filament thoriated tungsten, mesh type.

Filament voltage	V_f		10,4	V
Filament current	I_f		120	A
Filament peak starting current	I_{f_p}	max.	750	A
Cold filament resistance	R_{f_o}		10,5	mΩ
Waiting time	T_w	min.	1	s

The filament is designed to accept temporary fluctuations of ±5%.

TYPICAL CHARACTERISTICS

Anode voltage	V_a	8	kV
Grid no. 2 voltage	V_{g_2}	700	V
Anode current	I_a	2,4	A
Transconductance	S	60	mA/V
Amplification factor	μ	8,5	

CAPACITANCES

	grounded cathode		grounded grid		
Input	$C_{g_1(a)}$	135	$C_{f(a)}$	69	pF
Output	$C_{a(g_1)}$	23	$C_{a(f)}$	23	pF
Anode to grid no. 1	C_{ag_1}	0,85			pF
Anode to filament			C_{af}	0,25	pF

TEMPERATURE LIMITS

Absolute max. envelope temperature	t_{env}	max.	240	^oC
Recommended max. seal temperature	t	max.	200	^oC

→ COOLING

See cooling curves.
Direction of airflow: see outline drawing.

To obtain optimum life the temperature of the seals and of the envelope should be kept below 200 ^oC.

V_a (kV)

AIR COOLED V.H.F. POWER TETRODE

Forced air cooled coaxial power tetrode in metal-ceramic construction primarily intended for use as grid-driven linear broadband amplifier with high power gain in TV band I and III transmitters and transposers. The type is also very suitable for FM broadcast applications.

QUICK REFERENCE DATA			
Class-AB linear amplifier (vision)			
Frequency	f	175,25	MHz
Anode voltage	V_a	3	kV
Output power in load (sync)	W_ℓ	1,1	kW
Power gain	G	20	dB
Class-AB F.M. telephony			
Frequency	f	260	MHz
Anode voltage	V_a	4	kV
Output power in load	W_ℓ	2,2	kW
Power gain	G	22	dB

HEATING : direct; filament thoriated tungsten, mesh type

Filament voltage	V_f		4,2	V
Filament current	I_f		53	A
Filament peak starting current	I_{fp}	max.	300	A
Cold filament resistance	R_{fo}		8,5	mΩ
Waiting time	T_w	min.	1	s

The filament is designed to accept temporary fluctuations of ±5%. ←

TYPICAL CHARACTERISTICS

Anode voltage	V_a	3	kV
Grid no. 2 voltage	V_{g2}	700	V
Anode current	I_a	500	mA
Transconductance	S	25	mA/V
Amplification factor	μ_{g2g1}	10	

CAPACITANCES, grounded cathode

Input	$C_{g1(a)}$	54	pF
Output	$C_{a(g1)}$	8	pF
Anode to grid no. 1	C_{ag1}	0,1	pF

TEMPERATURE LIMITS

Absolute max. envelope temperature	t_{env}	max.	240	^{o}C
Recommended max. seal temperature	t	max.	200	^{o}C

→ **COOLING**

Direction of airflow: see drawing

W_a (W)	h (m)	t_i (^{o}C)	q (m^3/min)	p_i (Pa *)	t_o (^{o}C)
2000	0	35	2,00	530	92
1500	0	35	1,30	280	103
1000	0	35	0,80	140	113
2000	0	55	2,40	670	107
1500	0	55	1,55	340	118
1000	0	55	0,95	180	127
2000	1500	35	2,58	670	89
1500	1500	35	1,68	340	99
1000	1500	35	1,03	180	109
2000	3000	25	2,78	690	81
1500	3000	25	1,80	350	91
1000	3000	25	1,11	190	101

To obtain optimum life the temperature of the seals and of the envelope should be kept below 200 ^{o}C.

ACCESSORIES

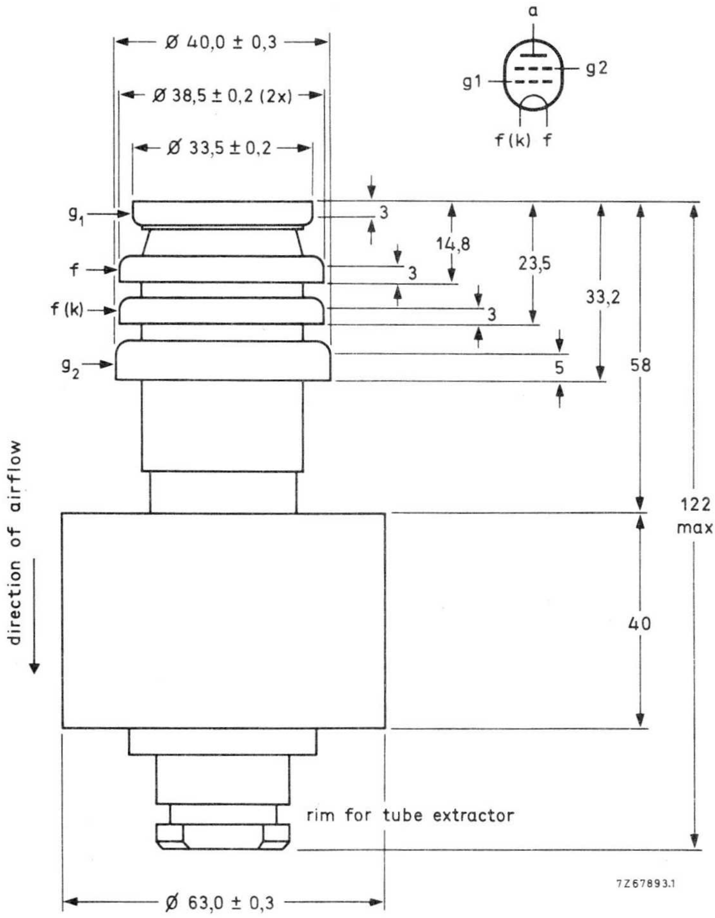
Band III amplifier circuit assembly (vision)	type 40776
Band III amplifier circuit assembly (sound)	type 40777
Band II amplifier circuit assembly (sound)	type 40778

*) 1 Pa ≈ 0,1 mm H_2O.

MECHANICAL DATA Dimensions in mm

Net mass : 0, 55 kg

Mounting position : vertical with anode up or down



Tube extractor type 40750; catalogue number 7322 120 02140.

AIR COOLED U.H.F POWER TETRODE

Forced-air cooled coaxial power tetrode in metal-ceramic construction. The tube features a high gain and a high linearity and is primarily intended for use as linear broadband amplifier in band IV/V TV transmitters and transposers.

QUICK REFERENCE DATA			
Class AB linear amplifier			
Frequency	f	860	MHz
Anode voltage	V_a	5,5	kV
Output power in load, sync	$W_{\ell(sync)}$	6	kW
Power gain	G	17	dB
TV transposer service			
Frequency	f	470 to 860	MHz
Anode voltage	V_a	5,5	kV
Output power in load, sync	$W_{\ell(sync)}$	2,2	kW
Power gain	G	16,5	dB

HEATING : direct; thoriated tungsten filament

Filament voltage	V_f		5	V
Filament current	I_f		130	A
Filament peak starting current	I_{fp}	max.	800	A
Cold filament resistance	R_{fo}		4,5	mΩ
Waiting time	T_W	min.	1	s

The filament is designed to accept temporary fluctuations of ±5%.

TYPICAL CHARACTERISTICS

Anode voltage	V_a	2	kV
Grid no. 2 voltage	V_{g2}	800	V
Anode current	I_a	6	A
Transconductance	S	140	mA/V
Amplification factor	μ_{g2g1}	8	

Data based on pilot-production tubes.

CAPACITANCES, grounded-grid

Input	$C_{f(a)}$	62	pF
Output	$C_{a(f)}$	12	pF
Anode to filament	C_{af}	< 0, 1	pF

TEMPERATURE LIMITS

Absolute max. envelope temperature	t_{env}	240	^oC
Recommended max. seal temperature	t_s	200	^oC

→ **COOLING**

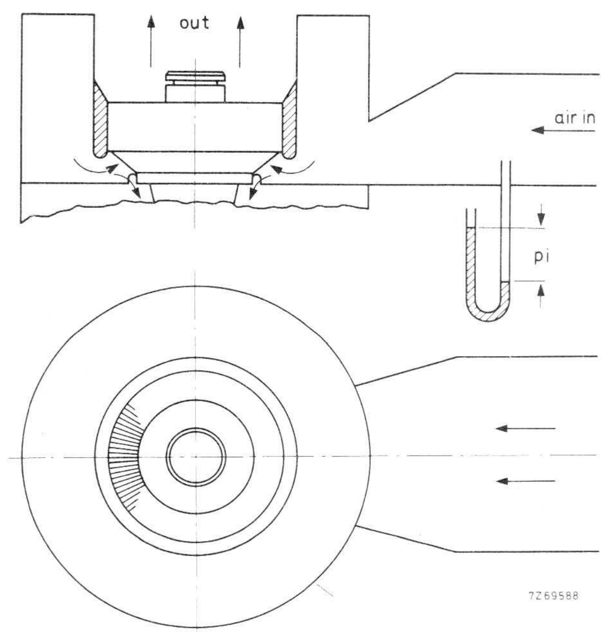
Anode dissipation W_a (kW)	Inlet temperature t_i (^oC)	Height h (m)	Rate of flow q_{min} (m^3/min)	Pressure drop p_i (Pa *)
6	35	0	5, 4	520

To obtain optimum life the temperature of the seals and of the envelope should be kept below 200 ^oC.

For direction of air flow see outline drawing.

* 1 Pa ≈ 0, 1 mm H_2O.

The air should be ducted so that sufficient air is directed to the seals to keep the seal temperature below the limit.

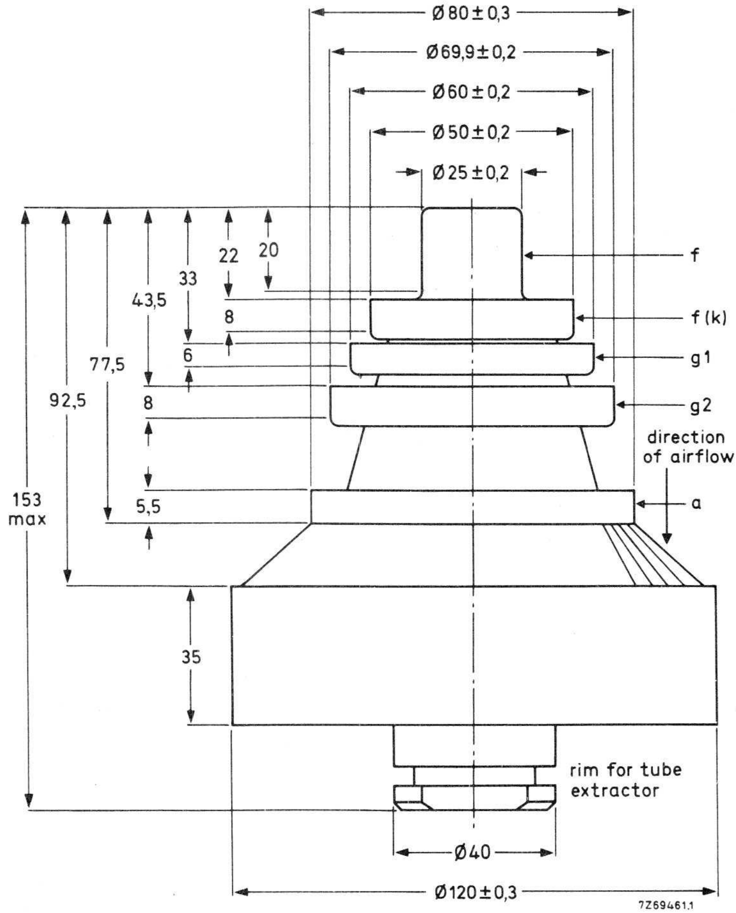


MECHANICAL DATA

Dimensions in mm

Net mass: ≈ 2,5 kg

Mounting position: vertical with anode up or down



R.F. CLASS AB LINEAR AMPLIFIER FOR TELEVISION SERVICE*

Negative modulation, positive synchronization (CCIR system).
Unless otherwise stated, the voltages are given with respect to the cathode.

LIMITING VALUES (Absolute max. rating system)

Power gain	G		16,5	dB	8) 9)
Intermodulation products	d	≤	−55	dB	7)

NOTES

1) To be adjusted for the stated no-signal anode current. Voltage range −70 to −100 V.

2) With double-tuned circuit.

3) Black signal including line sync pulses.

4) A picture/sync ratio of 75/25 for the outgoing signal requires a ratio of max. 70/30 for the incoming signal, in which case the sync compression is 30/25.

5) Measured with a saw-tooth amplitude, running from 17% to 75% of the peak sync value, with a superimposed 4,43 MHz sine-wave having a 10% peak-to-peak value.

6) At a CW output power = 2,2 kW.

7) Three-tone test method (vision carrier −8 dB, sound carrier −10 dB, sideband carrier −16 dB with respect to peak sync = 0 dB).

8) Losses in input circuit taken into account.

9) Losses in output circuit taken into account.

TEMPERATURE LIMITS (Absolute max. rating system)

Anode temperature measured on base end of anode surface at junction with fins	t_a	max. 250	°C
Anode seal temperature	t_s	max. 200	°C
Base seals and grid No. 2 seal temperature	t_s	max. 175	°C

COOLING air inlet temperature t_i = 20 °C, altitude h = 0 m [1])

With an air system socket			
Air flow	q	0.16	m^3/min
Pressure drop	p_i	7	mm H_2O
Without an air system socket			
Air flow	q	0.15	m^3/min
Pressure drop	p_i	7	mm H_2O

---

[1]) At higher altitudes and ambient temperatures, an increase in air flow is necessary to maintain the respective seal temperatures and the anode temperature within the maximum ratings.

With an air system socket

The air is directed over the base seals, past the grid No. 2 seal, glass envelope and anode seal, and through the radiator to provide effective cooling with minimum air flow.

Without air system socket

Adequate cooling air must be directed over the base seals, past the envelope, and through the radiator.

ACCESSORIES

Socket	Johnson 124-110-1
Chimney	Johnson 124-111-1 or equivalent

SHOCK AND VIBRATION RESISTANCE

Shock

The tube is subjected 5 times in each of 4 positions to an acceleration of 500 g supplied by an NRL shock machine with the hammer lifted over an angle of 30°.

Vibration

The tube is subjected to vibration frequencies from 25 Hz to 2000 Hz with an acceleration of 10 g.

MECHANICAL DATA

R.F. POWER TETRODE

Forced-air cooled tetrode in ceramic-metal construction intended for use in S.S.B. transmitters.

	QUICK REFERENCE DATA		
Freq. (MHz)	S.S.B.		
	V_a (V)	W_ℓ (W)PEP	d_3 (dB)
7	2000	271	-26
7	2000	436	-23

HEATING: indirect; oxide coated cathode

Heater voltage	V_f	25.6	V ± 5% [1]
Heater current	I_f	560	mA
Waiting time	T_w	min. 30	s

CAPACITANCES

Grid No.1 to all except anode	$C_{g_1}(a)$	17.0	pF
Anode to all except grid No.1	$C_{a(g_1)}$	4.7	pF
Anode to grid No.1	C_{ag_1}	0.06	pF

TYPICAL CHARACTERISTICS

Anode voltage	V_a	500		V
Grid No.2 voltage	V_{g_2}	250	300	V
Anode current	I_a	200		mA
Grid No.2 current	I_{g_2}	-	50	mA
Transconductance	S	12	-	mA/V
Amplification factor	$\mu_{g_2g_1}$		5.2	

TEMPERATURE LIMITS (Absolute max. rating system)

Temperature of all seals	t_s	max. 250	°C
Temperature of anode core	t_a	max. 250	°C

[1]) Short term variations of ± 10% will not damage the tube, but variations in performance must be expected.

COOLING: Forced air

Anode dissipation	Height above sea level	Inlet temperature	Min. required air flow	Pressure drop
W_a	h	t_i	q min	p_i
250 W	0 m	50 °C	0.15 m^3/min	15 mm H_2O
250 W	3000 m	50 °C	0.19 m^3/min	22 mm H_2O

ACCESSORIES

Socket — Johnson 124-110-1

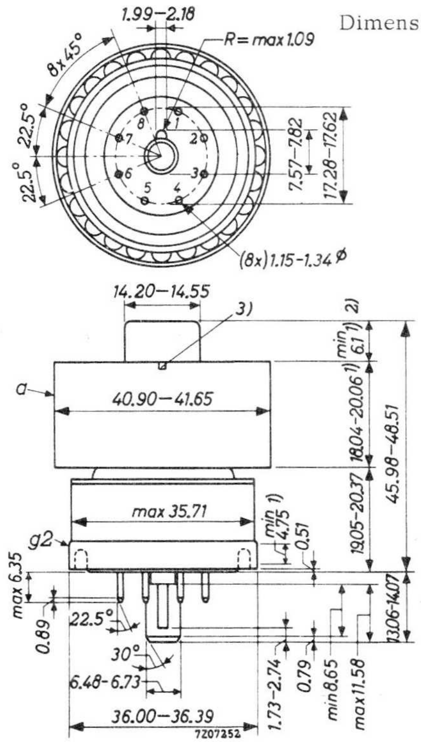
Chimney — Johnson 124-111-1 or equivalent

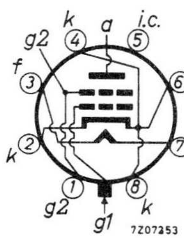
MECHANICAL DATA

Dimensions in mm

Net weight: 120 g

Mounting position: any





1) Contact surface

2) Use this contact surface for frequencies up to 30 MHz only

3) Index aligned with grid No. 1 guide lug

BAND III AMPLIFIER CIRCUIT ASSEMBLY FOR YL1440 VISION AND COMBINED SOUND AND VISION

Continuously tunable cavity-type circuit assembly to be used with YL1440 to form a broad-band grounded-grid linear amplifier for television signals in Band III. The unit thus obtained can be put to good use in any of the principal monochrome and colour television systems.

QUICK REFERENCE DATA				
Class AB linear amplifier (vision)				
Frequency	170	to	260	MHz
Anode voltage			3	kV
Output power in load , sync			1,55	kW
Power gain			26	
Frequency	170	to	260	MHz
Anode voltage			2,5	kV
Output power in load , sync			0,7	kW
Power gain			23	
Class AB amplifier for television transposer service				
Frequency	175	to	225	MHz
Anode voltage			2,5	kV
Output power in load , sync			0,55	kW
Power gain			30	

FREQUENCY RANGE

170 to 247 MHz continuously tunable. Up to 260 MHz with minor, channel dependent, modifications.

OPERATING CONDITIONS (For YL1440)

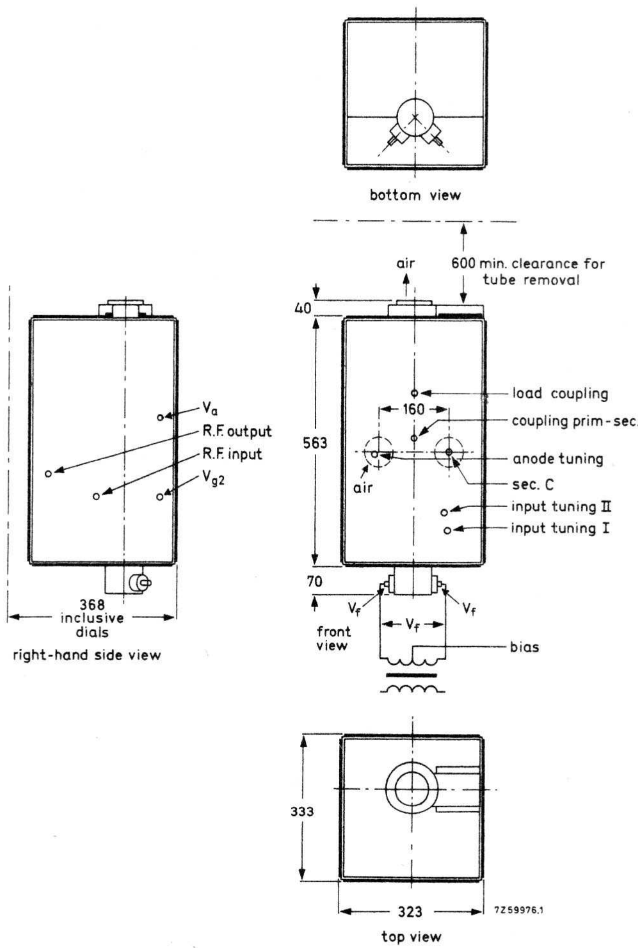
For detailed operating conditions reference is made to the data sheets for tube type YL14 YL1440.

MECHANICAL DATA

Dimensions in mm

Dimensions : approx. 673 x 333 x 323 mm^3

Net weight : approx. 38 kg



COOLING

See cooling curves.
Direction of airflow: see drawing page 6.
Either sucking and blowing is possible via connections on the top panel and the rear panel.

IMPEDANCES

Input : 50 Ω (coaxial female connector type N)

Output : 50 Ω (coaxial female connector type HN)

ENVIRONMENTAL DATA

Ambient temperature : 0 ^{o}C to +55 ^{o}C

Altitude : max. 3000 m

Relative humidity : up to 90 %

VOLTAGE STANDING-WAVE RATIO

Input : max. permissible 1.3 for acceptable performance

Output : max. permissible 1.3 for acceptable performance

ADDITIONAL COMPONENTS

a) Delivered with the assembly

Tube extractor	7322 120 02140
Mating male input connector	Radiall type N
Mating male output connector	Radiall type R7050
Mating connector for anode voltage	Radiall type R13060
Mating connector for screen grid voltage	Radiall type R9510

b) Recommended

The use of circulator 2722 162 01191 (170 to 200 MHz) or 2722 162 1201 (200 to 230 MHz) is recommended.

BAND III AMPLIFIER CIRCUIT ASSEMBLY FOR YL1420 VISION AND COMBINED SOUND AND VISION

Continuously tunable cavity-type circuit assembly to be used with YL1420 to form a broad-band grounded-grid linear amplifier for television signals in Band III. The unit thus obtained can be put to good use in any of the principal monochrome and colour television systems.

QUICK REFERENCE DATA				
Class AB linear amplifier (vision)				
Frequency	170	to	230	MHz
Anode voltage			5	kV
Output power in load, sync			8,6	kW
Power gain			24	
Frequency	170	to	230	MHz
Anode voltage			4	kV
Output power in load, sync			6,25	kW
Power gain			24	
Class AB amplifier for television transposer service				
Frequency	175	to	225	MHz
Anode voltage			4	kV
Output power in load, sync			2,5	kW
Power gain			30	

FREQUENCY RANGE

170 to 230 MHz continuously tunable.

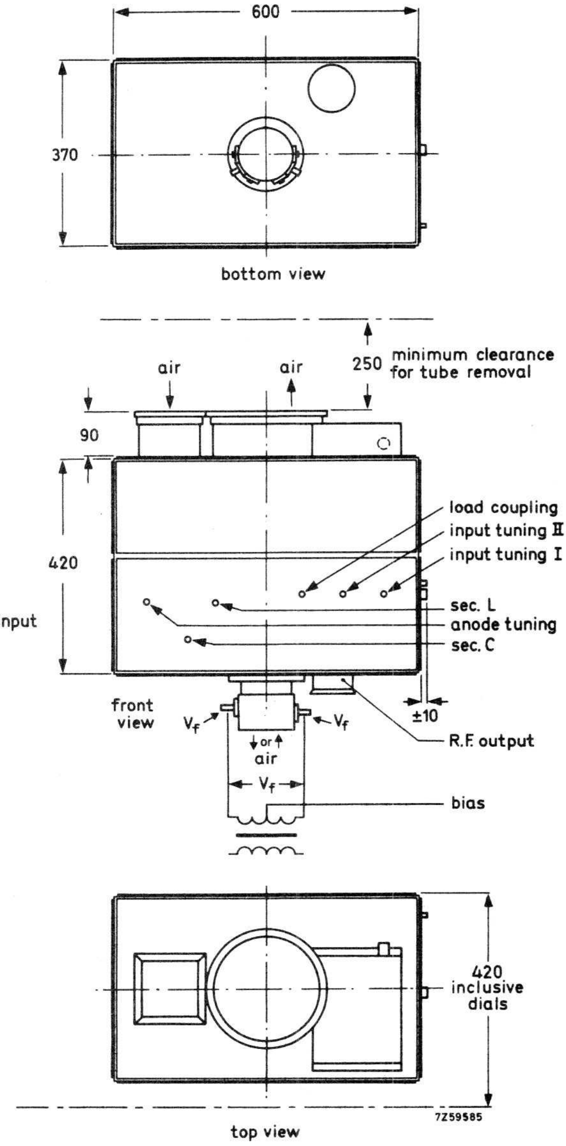
OPERATING CONDITIONS (For YL1420)

For detailed operating conditions reference is made to the data sheets for tube type YL1420.

MECHANICAL DATA

Dimensions in mm

Dimensions : approx. 600 x 620 x 370 mm^3
Net weight : approx. 67 kg



R.F. output connector

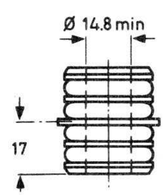
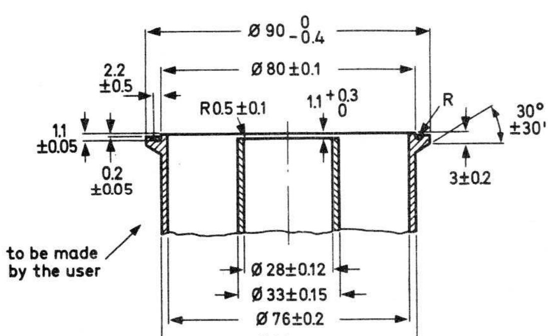
clamping ring 7322 120 04670

spigot 7322 120 04680



connector for inner conductor 7322 120 04690



termination coaxial line 76/33

COOLING

See cooling curves.
Direction of airflow: see drawing page 7.
Either sucking and blowing is possible via connections on the top panel.

IMPEDANCES

Input : 50 Ω (coaxial female connector, type N)

Output : 50 Ω (coaxial connector: see drawing page 3).

ENVIRONMENTAL DATA

Ambient temperature : 0 °C to +55 °C

Altitude : max. 3000 m

Relative humidity : up to 90%

VOLTAGE STANDING WAVE RATIO

Input : max. permissible 1,3 for acceptable performance

Output : max. permissible 1,3 for acceptable performance

ADDITIONAL COMPONENTS

a) Delivered with the assembly

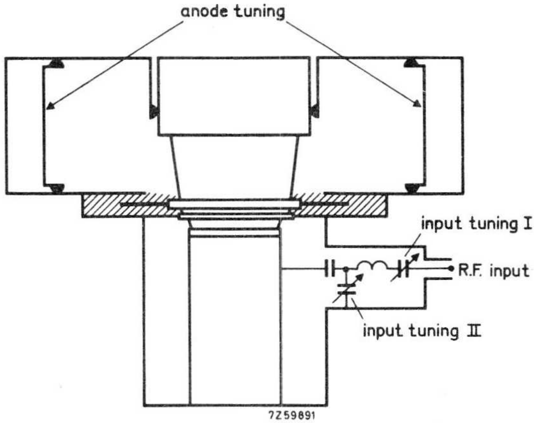
Tube extractor	7322 120 07850
Mating male input connector	Radiall type N
Output connector	
connector for inner conductor	7322 120 04690
spigot for outer conductor	7322 120 04680
clamping ring for outer conductor	7322 120 04670
Mating connector for anode voltage	Radiall type R13060
Mating connector for screen grid voltage	Radiall type R9510
Coupling loop for 175, 25 MHz	8222 032 57140
Coupling loop for remaining frequencies except 223, 25 MHz [1])	8222 032 57150
Spanner for fitting the coupling loop	

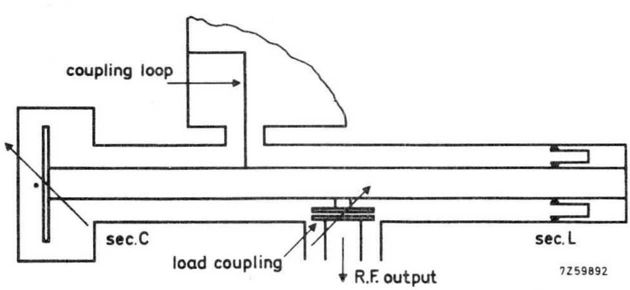
b) Recommended

The use of circulator 2722 162 01191 (170 to 200 MHz) or 2722 162 01201 (200 to 230 MHz) is recommended.

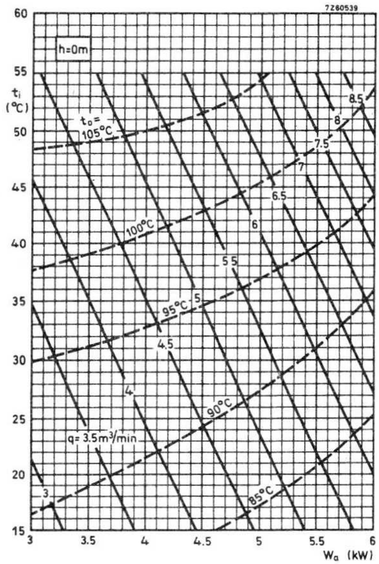
[1]) For 223, 25 MHz a different coupling loop is needed, which can be supplied on request.

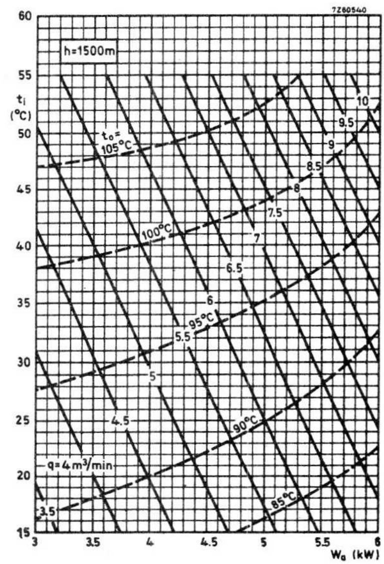
CIRCUIT DIAGRAM

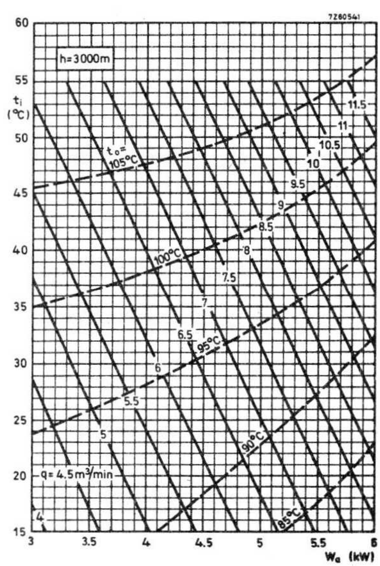


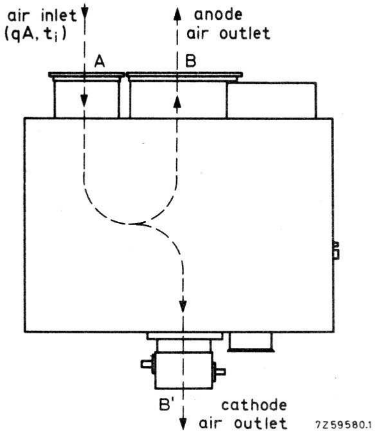


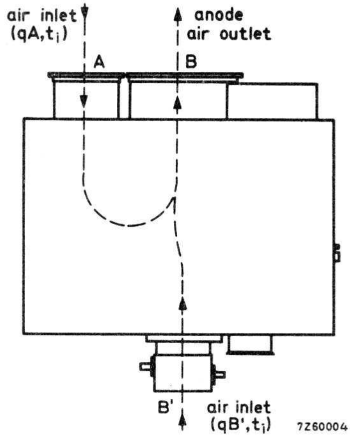
Cooling curves

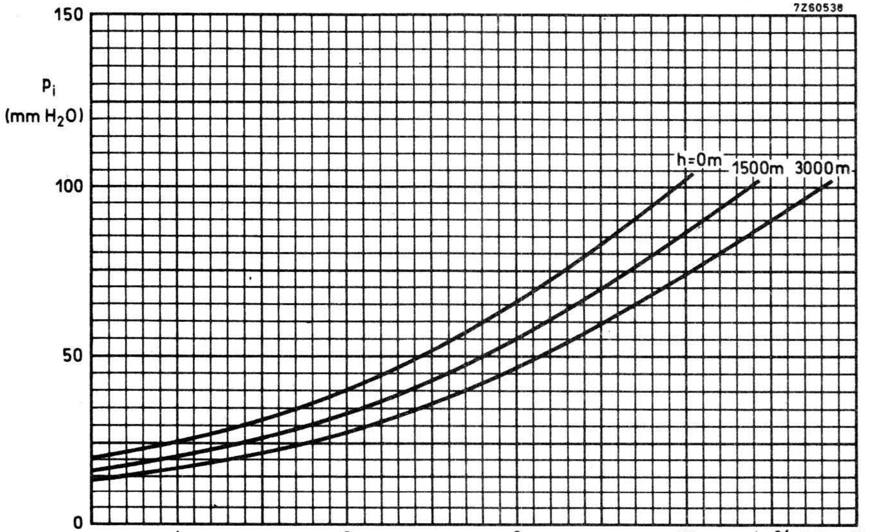












Pressure drop p_i across cavity with YL1420 as a function of airflow q.
p_i = pressure drop from plane A to plane B or B'
For blowing $q = q_A$
For sucking $q = q_A + q_{B'}$

BAND III AMPLIFIER CIRCUIT ASSEMBLY FOR YL1420 SOUND

Continuously tunable cavity-type circuit assembly to be used with YL1420 to form a grounded-grid amplifier of frequency-modulated signal in Band III.

QUICK REFERENCE DATA			
Frequency (MHz)	Class B amplifier (sound)		
	V_a (kV)	W_ℓ (kW) CCIR system	Power gain
170 to 230	7	10.5	32

FREQUENCY RANGE

170 to 230 MHz, continuously tunable.

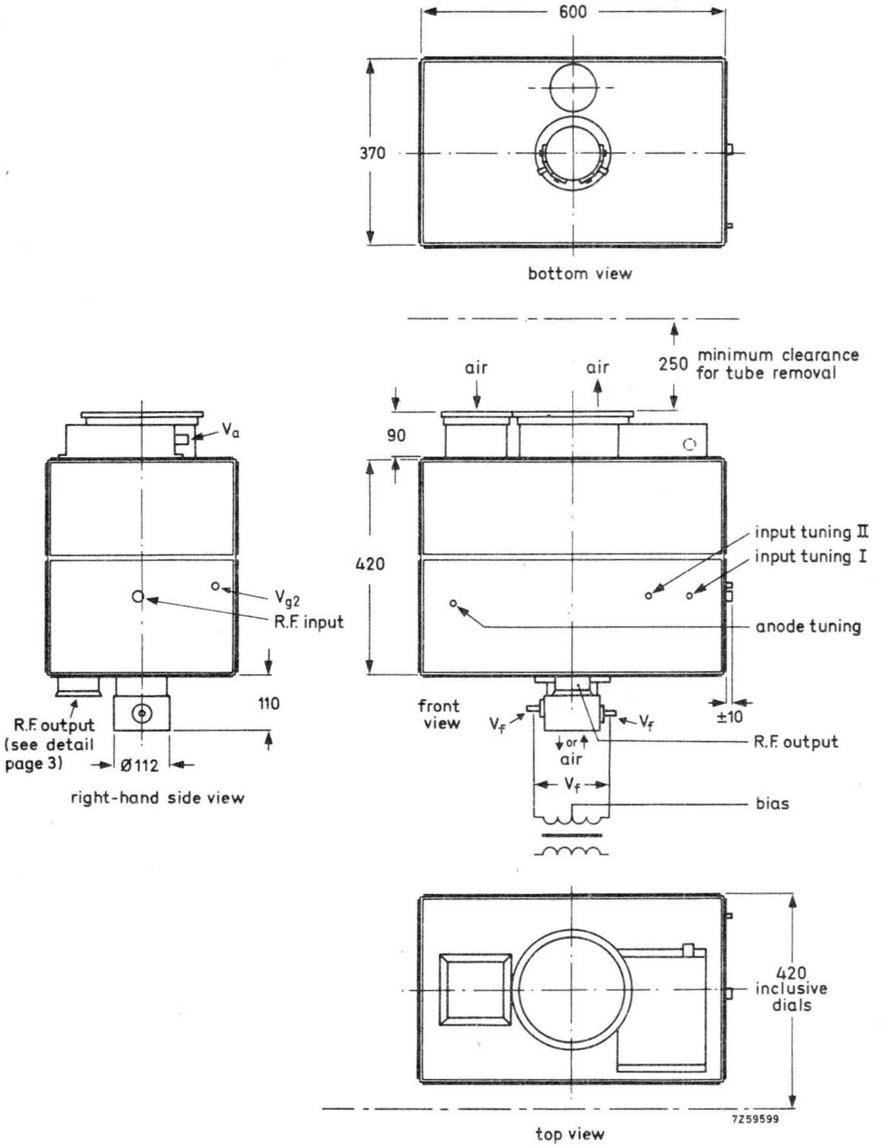
OPERATING CONDITIONS (For YL1420)

For detailed operating conditions reference is made to the data sheets for tube type YL1420.

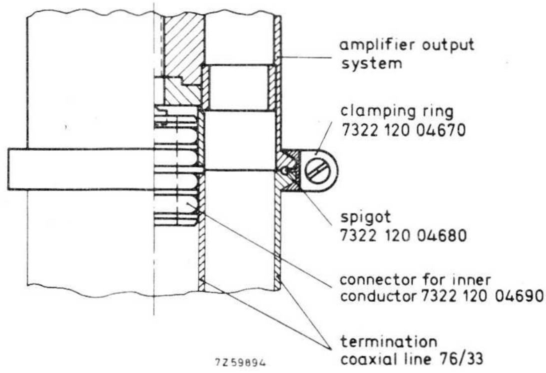
MECHANICAL DATA

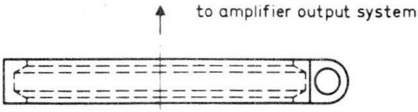
Dimensions in mm

Dimensions : approx. 600 x 620 x 370 mm^3
Net weight : approx. 54 kg



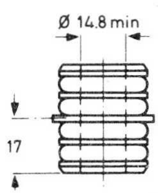
R.F. output connector





clamping ring 7322 120 04670

spigot 7322 120 04680



connector for inner conductor 7322 120 04690

COOLING

See cooling curves.
Direction of airflow: see drawing page 7.
Both sucking and blowing is possible via connection on the top panel.

IMPEDANCES

Input : 50 Ω (coaxial female connector, type N)

Output : 50 Ω (coaxial connector: see drawing page 3)

ENVIRONMENTAL DATA

Ambient temperature : 0 ^{o}C to +55 ^{o}C

Altitude : max. 3000 m

Relative humidity : up to 90 %

VOLTAGE STANDING-WAVE RATIO

Input : max. permissible 1.3 for acceptable performance

Output : max. permissible 1.3 for acceptable performance

ADDITIONAL COMPONENTS

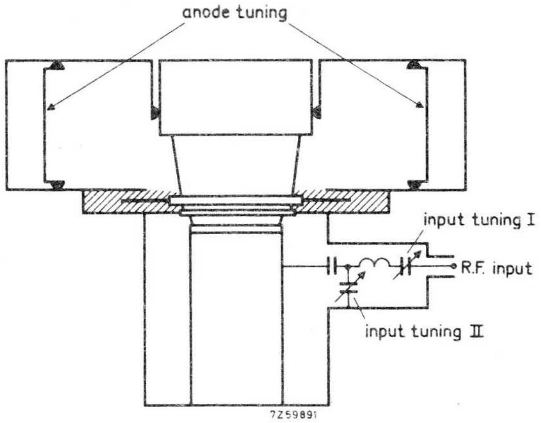
a) Delivered with the assembly

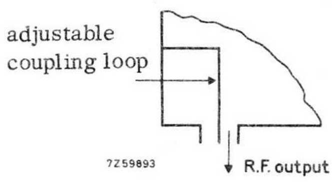
Tube extractor input connector	7322 120 07850
Mating male input connector	Radiall type N
Output connector	
connector for inner conductor	7322 120 04690
spigot for outer conductor	7322 120 04680
clamping ring for outer conductor	7322 120 04670
Mating connector for anode voltage	Radiall type R13060
Mating connector for screen grid voltage	Radiall type R9510

Recommended

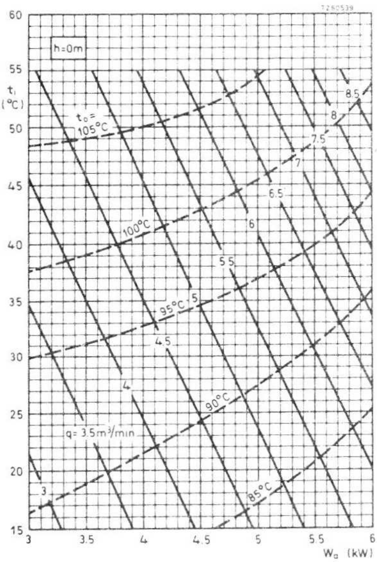
The use of circulator 2722 162 01191 (170 to 200 MHz) or
2722 162 01201 (200 to 230 MHz) is recommended.

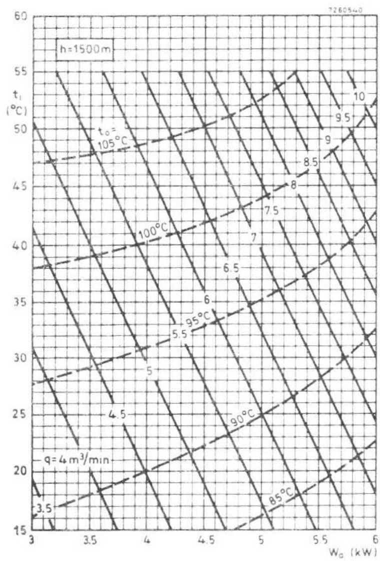
CIRCUIT DIAGRAM

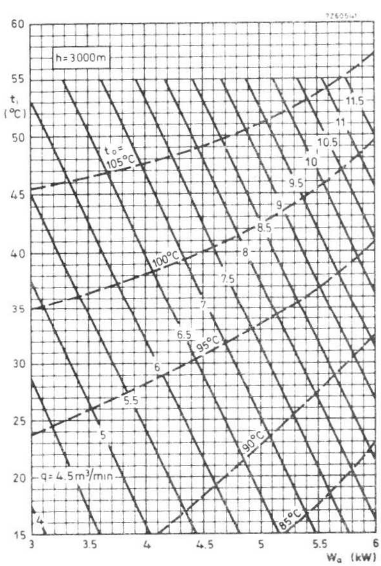


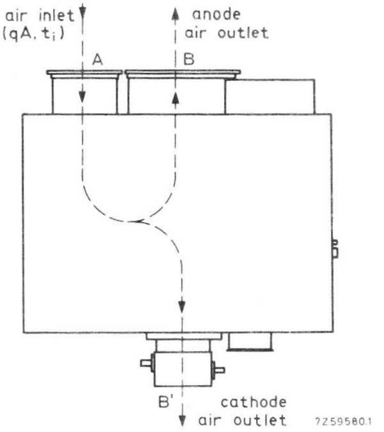


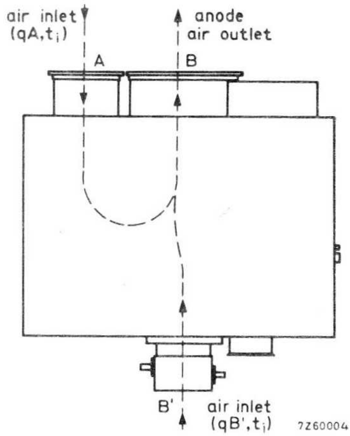
Cooling curves

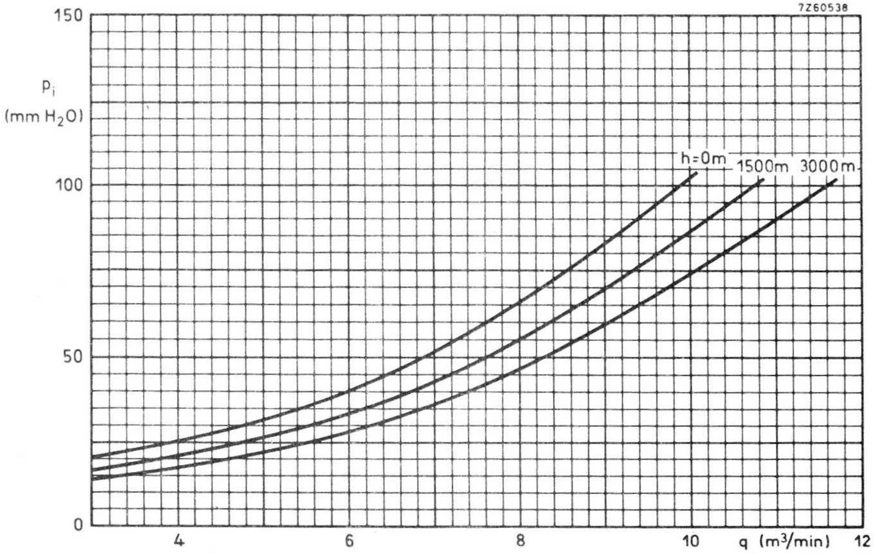












Pressure drop p_i across cavity with YL1420 as a function of airflow q.
p_i = pressure from plane A to plane B or B'
For blowing $q = q_A$
For sucking $q = q_A + q_{B'}$

BAND III AMPLIFIER CIRCUIT ASSEMBLY FOR YL1430 VISION AND COMBINED SOUND AND VISION

Continuously tunable cavity-type circuit assembly to be used with YL1430 to form a broad-band grounded-grid linear amplifier for television signals in Band III. The unit thus obtained can be put to good use in any of the principal monochrome and colour television systems.

QUICK REFERENCE DATA				
Class AB linear amplifier (vision)				
Frequency	170	to	230	MHz
Anode voltage			7	kV
Output power in load, sync			18,4	kW
Power gain			25	
Frequency	170	to	230	MHz
Anode voltage			6	kV
Output power in load, sync			12,5	kW
Power gain			30	
Class AB amplifier for television transposer service				
Frequency	175	to	225	MHz
Anode voltage			6	kV
Output power in load, sync			7	kW
Power gain			32	

FREQUENCY RANGE

170 to 230 MHz continuously tunable.

OPERATING CONDITIONS (For YL1430)

For detailed operating conditions reference is made to the data sheets for tube type YL1430.

MECHANICAL DATA

Dimensions in mm

Dimensions : approx. 600 x 620 x 370 mm^3
Net weight : approx. 67 kg

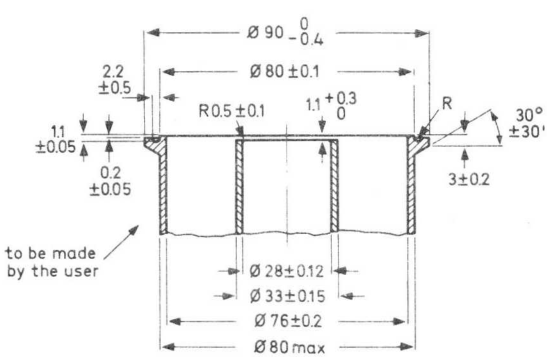
connector for inner conductor 7322 120 04690



termination coaxial line 76/33

COOLING

See cooling curves.
Direction of airflow: see drawing page 7.
Either sucking and blowing is possible via connections on the top panel.

IMPEDANCES

Input : 50 Ω (coaxial female connector, type N)

Output : 50 Ω (coaxial female connector: see drawing page 3)

ENVIRONMENTAL DATA

Ambient temperature : 0 °C to +55 °C

Altitude : max. 3000 m

Relative humidity : up to 90%

VOLTAGE STANDING WAVE RATIO

Input : max. permissible 1,3 for acceptable performance

Output : max. permissible 1,3 for acceptable performance

ADDITIONAL COMPONENTS

a) Delivered with the assembly

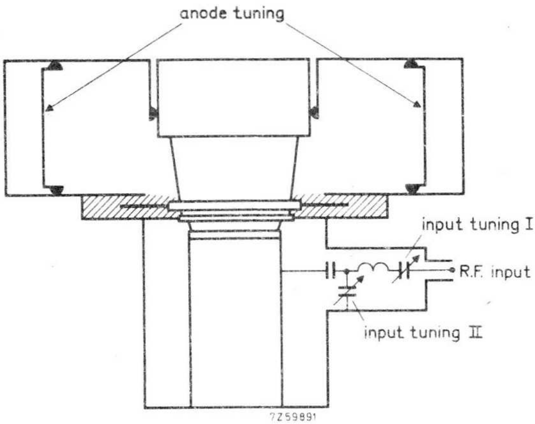
Tube extractor	7322 120 07850
Mating male input connector	Radiall type N
Output connector	
connector for inner conductor	7322 120 04690
spigot for outer conductor	7322 120 04680
clamping ring for outer conductor	7322 120 04670
Mating connector for anode voltage	Radiall type R13060
Mating connector for screen grid voltage	Radiall type R9510
Coupling loop for 175, 25 MHz	7322 120 04730
Coupling loop for remaining frequencies except 224, 25 MHz	7322 120 04750
Insulating protection cap	7322 120 04760
Spanner for fitting the coupling loops	7322 120 04760

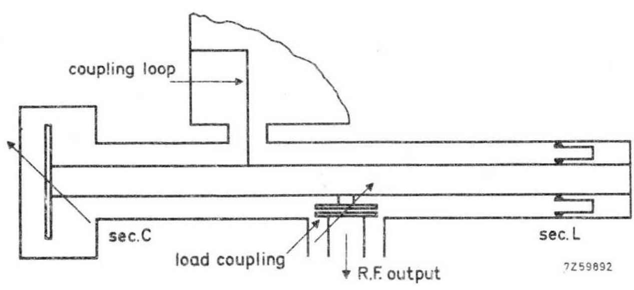
b) Recommended

The use of circulator 2722 162 01191 (170 to 200 MHz) or 2722 162 01201 (200 to 230 MHz) is recommended.

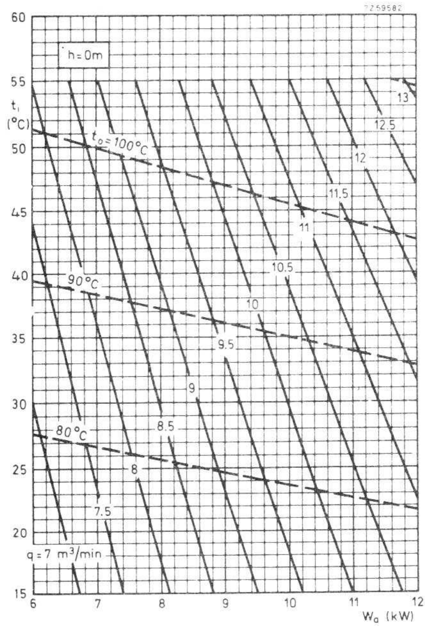
[1]) For 224, 25 MHz a different coupling loop is needed, which can be supplied on request.

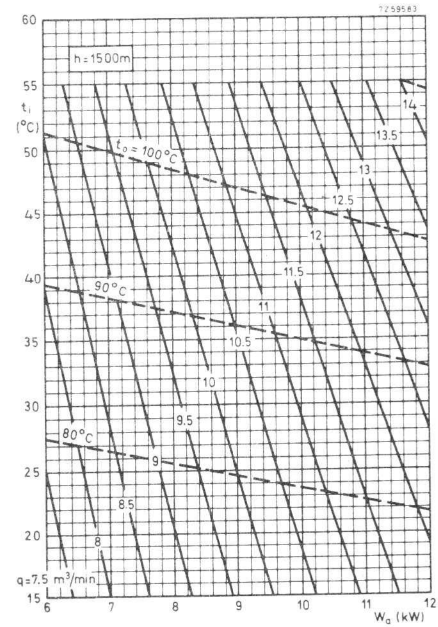
CIRCUIT DIAGRAM

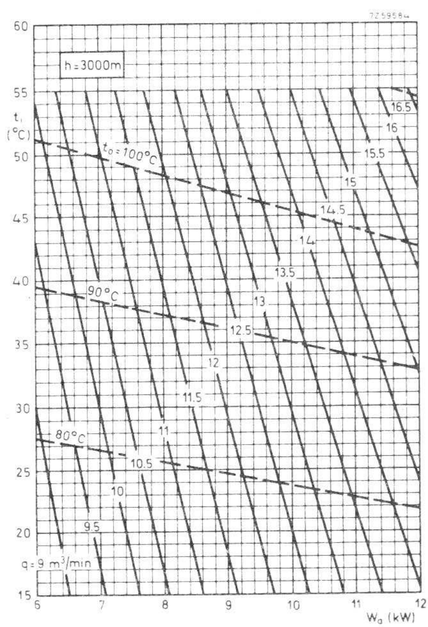


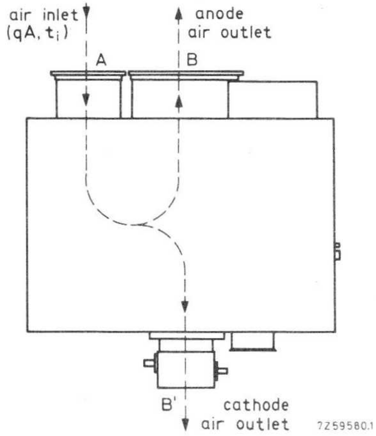


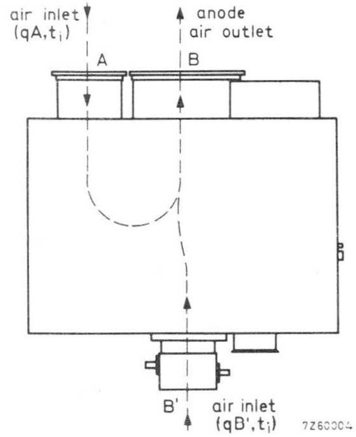
Cooling curves

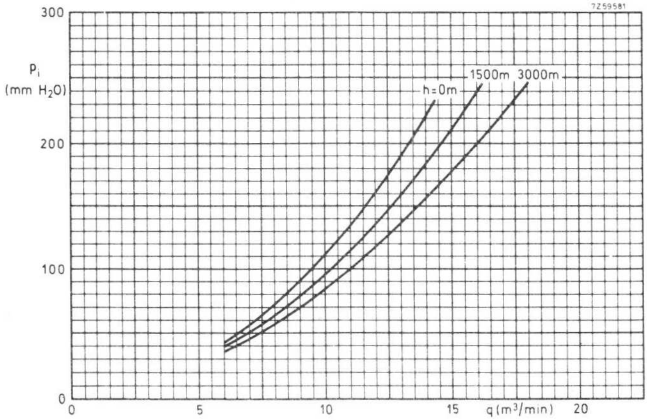










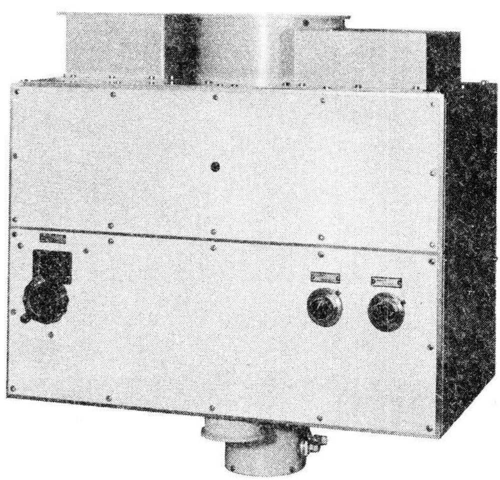


Pressure drop q_i across cavity with YL1430 as a function of airflow q.
p_i = pressure drop from plane A to plane B or B'
For blowing $q = q_A$
For sucking $q = q_A + q_{B'}$

BAND III AMPLIFIER CIRCUIT ASSEMBLY FOR YL1430 SOUND

Continuously tunable cavity-type circuit assembly to be used with YL1430 to form a grounded-grid amplifier of frequency modulated signals in band III.

RZ 29115-9



QUICK REFERENCE DATA			
Frequency (MHz)	Class B amplifier (sound)		
	V_a (kV)	W_ℓ (kW) CCIR system	Power gain
170 to 230	7.5	13	33

FREQUENCY RANGE

170 to 230 MHz, continuously tunable.

OPERATING CONDITIONS (For YL1430)

For detailed operating conditions reference is made to the data sheets for tube type YL1430.

MECHANICAL DATA Dimensions in mm

For sucking $q = q_A + q_{B'}$

BAND I AMPLIFIER CIRCUIT ASSEMBLY FOR YL1440 VISION

Channel tuned cavity-type circuit assembly to be used with YL1440 to form a broad-band grounded-grid linear amplifier for television signals in Band I. The unit thus obtained can be put to good use in any of the principal monochrome and colour television systems.

QUICK REFERENCE DATA				
Class AB linear amplifier (vision)				
Frequency	48	to	83	MHz
Anode voltage			2,5	kV
Output power in load, sync			1,17	kW
Power gain			14	
Frequency	48	to	83	MHz
Anode voltage			2	kV
Output power in load, sync			0,67	kW
Power gain			16	

FREQUENCY RANGE

48,25 to 69,25 MHz and 77,25 to 83,25 MHz	channel tuned

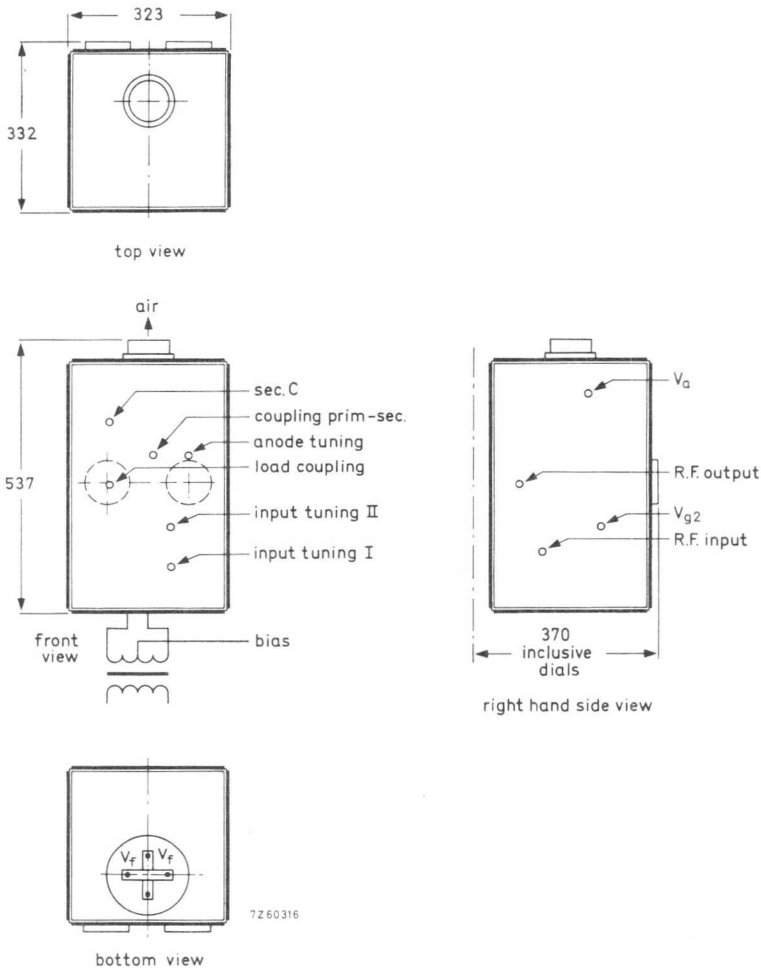
OPERATING CONDITIONS (For YL1440)

For detailed operating conditions reference is made to the data sheets for tube type YL1440.

MECHANICAL DATA

Dimensions in mm

Dimensions: approx. 516 x 323 x 323 mm^3
Net weight : approx. 23 kg



COOLING

See cooling curves.
Direction of airflow: see drawing page 6.
Either sucking and blowing is possible via connections on the top panel and the rear panel.

IMPEDANCES

Input : 50 Ω (coaxial female connector type N)

Output : 50 Ω (coaxial female connector type HN)

ENVIRONMENTAL DATA

Ambient temperature	: 0 °C to +55 °C
Altitude	: max. 3000 m
Relative humidity	: up to 90 %

VOLTAGE STANDING-WAVE RATIO

Input : max. permissible 1.3 for acceptable performance

Output : max. permissible 1.3 for acceptable performance

ADDITIONAL COMPONENTS

<u>Delivered with the assembly</u>

Tube extractor	7322 120 02140
Mating male input connector	Radiall type N
Mating male output connector	Radiall type R7050
Mating connector for anode voltage	Radiall type R13060
Mating connector for screen grid voltage	Radiall type R9510
5 coils for vision carries	
5 coils for vision carrier frequencies 55.25; 61.25 to 62.25; 67.25; 77.25; 83.25 MHz	[1])
Spanner for fitting the coils	

[1]) Coils covering vision carrier frequencies other than specified can be delivered on request.

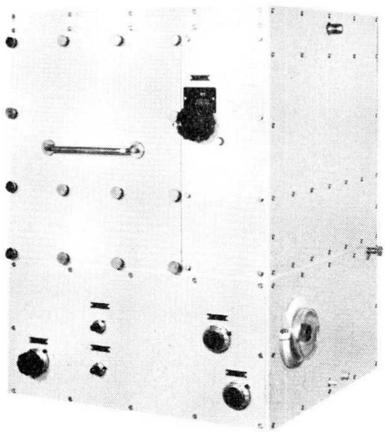
BAND I AMPLIFIER CIRCUIT ASSEMBLY FOR YL1430 OR YL1520

VISION

Amplifier circuit to be used with YL1430 or YL1520 to form a broad-band grounded grid linear amplifier for television signals in Band I.



RZ 29794-2

QUICK REFERENCE DATA				
		Class AB linear amplifier (vision)		
Frequency (MHz)	Type	V_a (kV)	W_ℓ sync (kW)(CCIR) system	Power gain
83.25 55.25 55.25	YL1430	5.5 5.5 4.0	13.2 13.2 6.4	20 18 18
83.25 55.25	YL1520	6.5	20 20	24 22

FREQUENCY RANGE

55.25 to 69.25 MHz and
77.25 to 83.25 MHz } channel tuned

OPERATING CONDITIONS (For YL1430 or YL1520)

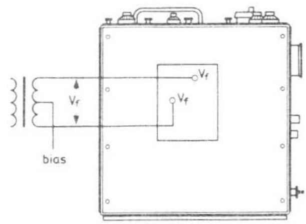
For detailed operating conditions reference is made to the data sheets for tube type YL1430 or YL1520.

MECHANICAL DATA

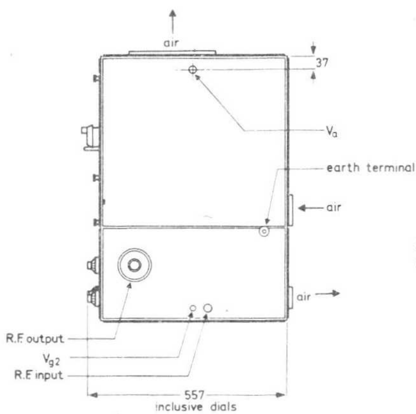
Dimensions in mm

Dimensions: approx. 700 x 500 x 500 mm^3

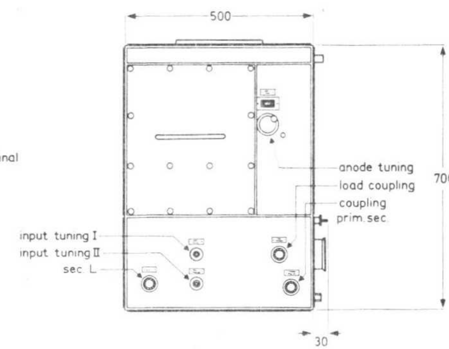
Net weight : approx. 70 kg



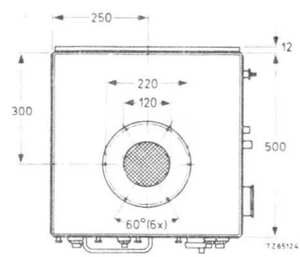
bottom view



right hand side view

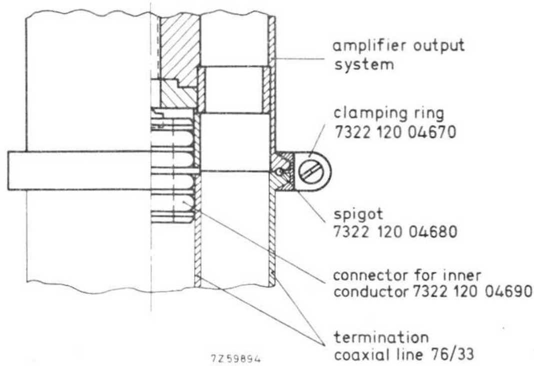


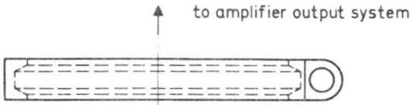
front view



top view

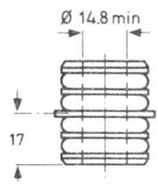
Output connector



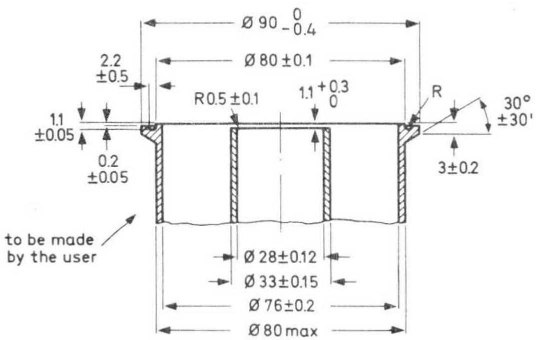


clamping ring 7322 120 04670

spigot 7322 120 04680



connector for inner conductor 7322 120 04690



termination coaxial line 76/33

COOLING

See cooling curve.
Direction of air flow: see page 8.

The cooling air, supplied by an external source, is admitted through an inlet in the rear panel.

IMPEDANCES

Input : 50 Ω (coaxial female connector, type N)
Output : 50 Ω (coaxial female connector, see drawing page 3)

ENVIRONMENTAL DATA

Ambient temperature	: 0 °C to +55 °C
Altitude	: max. 3000 m
Relative humidity	: up to 90%

VOLTAGE STANDING-WAVE RATIO

Input : max. permissible 1.3 for acceptable performance
Output : max. permissible 1.3 for acceptable performance

ADDITIONAL COMPONENTS

a) Delivered with assembly

Tube extractor	7322 120 07850	
Mating male input connector	Radiall type N	
Output connector		
connector for inner conductor	7322 120 04690	
spigot for outer conductor	7322 120 04680	
clamping ring for outer conductor	7322 120 04670	
Mating connector for anode voltage	Radiall type R13060	
Mating connector for screen grid voltage	Radiall type R9510	
Anode coil covering frequency range 55.25 to 67.25 MHz for YL1430 and 55.25 to 61.25 MHz for YL1520	----	1)
Elbow for secondary circuit covering frequency range 55.25 to 67.25 MHz for both types	----	

b) Not delivered with assembly

Anode coil covering frequency range 77.25 to 83.25 MHz for YL1430 and 67.25 to 83.25 MHz for YL1520	8222 032 11860	1)
Elbow for secondary circuit covering frequency range 77.25 to 83.25 MHz for both types	8222 032 11790	

1) For use on carrier frequencies other than specified please contact the manufacturer.

BAND III AMPLIFIER CIRCUIT ASSEMBLY FOR YL1520 *)

VISION AND COMBINED SOUND AND VISION

Continuously tunable cavity-type circuit assembly to be used with YL1520 to form a broad-band grounded-grid linear amplifier for television signals in Band III.
The unit thus obtained can be put to good use in any of the principal monochrome and colour television systems.

QUICK REFERENCE DATA				
Class AB linear amplifier (vision)				
Frequency	170	to	230	MHz
Anode voltage			8	kV
Output power in load , sync			27,5	kW
Power gain			28,5	
Class AB amplifier for television transposer service				
Frequency	175	to	225	MHz
Anode voltage			8	kV
Output power in load , sync			10,5	kW
Power gain			42	

FREQUENCY RANGE

170 to 230 MHz continuously tunable.

OPERATING CONDITIONS (For YL1520)

For detailed operating conditions reference is made to the data sheets for tube type YL1520.

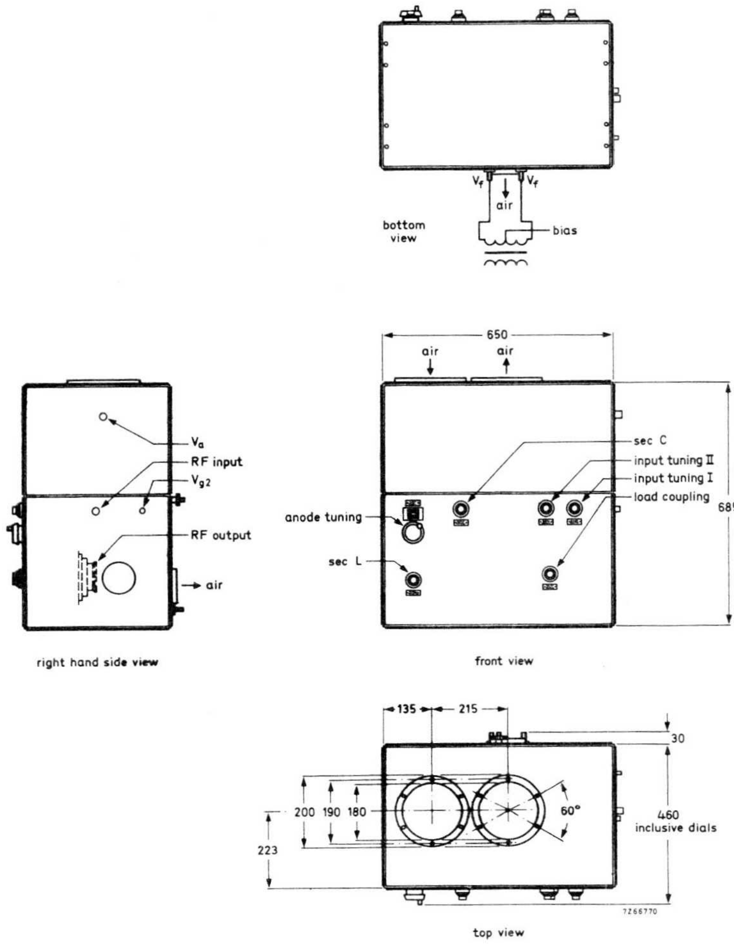
* Slight modifications make this cavity usable for YL1430 in the range 205 to 260 MHz.

MECHANICAL DATA

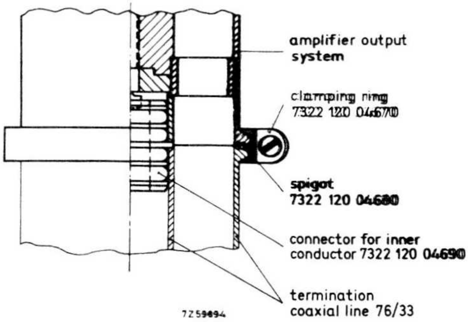
Dimensions in mm

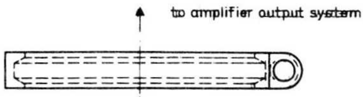
Dimensions: approx. 685 x 415 mm^3

Net weight: approx. 85 kg



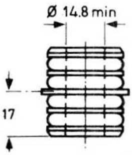
Output connector



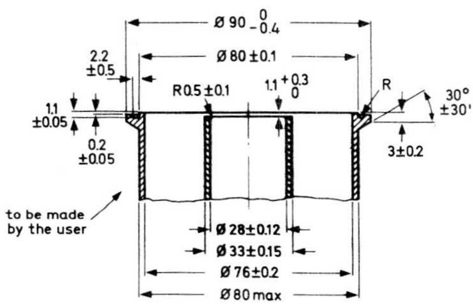


clamping ring 7322 120 04670

spigot 7322 120 04680



connector for inner conductor 7322 120 04690



termination coaxial line 76/33

COOLING

See cooling curves.
Direction of airflow: see drawing page 7.

IMPEDANCES

Input : 50 Ω (coaxial female connector, type HN)

Output: 50 Ω (coaxial female connector: see drawing page 3)

ENVIRONMENTAL DATA

Ambient temperature: 0 °C to +55 °C

Altitude : max. 3000 m

Relative humidity : up to 90%

VOLTAGE STANDING-WAVE RATIO

Input : max. permissible 1, 3 for acceptable performance

Output: max. permissible 1, 3 for acceptable performance

ADDITIONAL COMPONENTS

a) Delivered with the assembly

Tube extractor	7322 120 07850
Mating male input connector	Radiall type HN R7050
Output connector	
connector for inner conductor	7322 120 04690
spigot for outer conductor	7322 120 04680
clamping ring for outer conductor	7322 120 04670
Mating connector for anode voltage	Radiall type R13060
Mating connector for screen grid voltage	Radiall type R9510
Coupling loop for 175, 25 MHz	7322 120 04730

b) Recommended

The use of circulator 2722 162 01191 (170 to 200 MHz) or 2722 162 01201 (200 to 230 MHz) is recommended.

BAND II AMPLIFIER CIRCUIT ASSEMBLY FOR YL1470

Continuously tunable cavity-type circuit assembly to be used with YL 1470 to form a grounded-cathode amplifier of freqency-modulated signals in Band II.

QUICK REFERENCE DATA			
Frequency (MHz)	Class B amplifier		
	V_a (kV)	W_ℓ (kW) CCIR system	Power gain (dB)
87,5 - 108	7	11	22

FREQUENCY RANGE

87,5 MHz to 108 MHz, continuously tunable.

OPERATING CONDITIONS

For detailed operating conditions reference is made to the data sheets for tube type YL 1470.

COOLING

See cooling curves.
Direction of airflow: see drawing page 5. Only blowing is allowed.

IMPEDANCES

Input : 50 Ω (coaxial female connector, type N)
Output: 50 Ω (coaxial connector: EIA 1 $^5/_8$ in)

VOLTAGE STANDING - WAVE RATIO

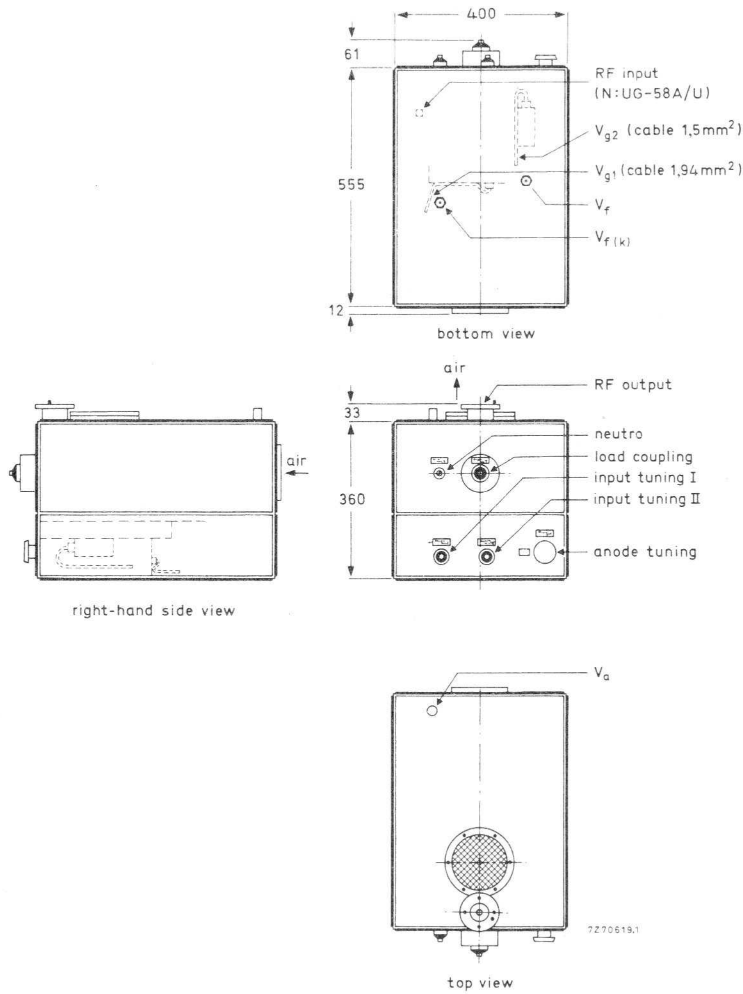
Input : max. permissible 1,3 for acceptable performance
Output: max. permissible 1,3 for acceptable performance

MECHANICAL DATA

Dimensions in mm

Dimensions: approx. 400 x 380 x 615 mm

Net mass : approx. 54 kg



ENVIRONMENTAL DATA

Ambient temperature: 0 °C to +55 °C

Altitude : max. 3000 m

Relative humidity : up to 90%

ADDITIONAL COMPONENTS

Supplied with the assembly

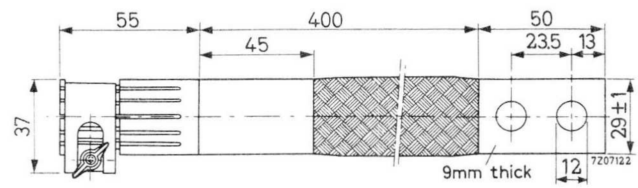
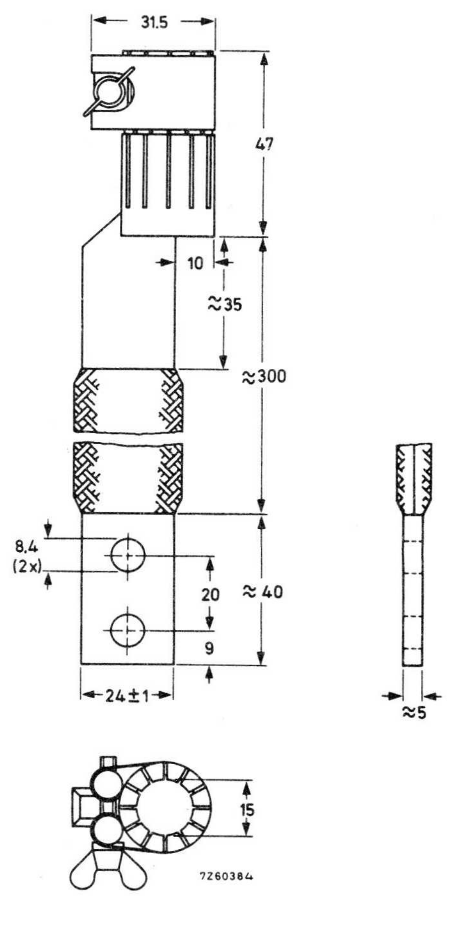
Material : glass

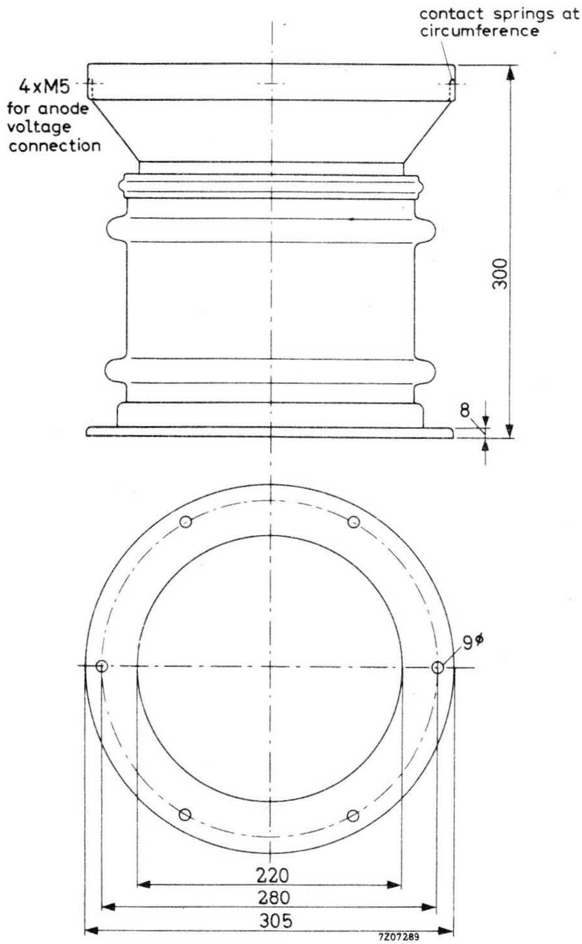
FILAMENT CONNECTOR WITH CABLE



FILAMENT CONNECTOR WITH CABLE



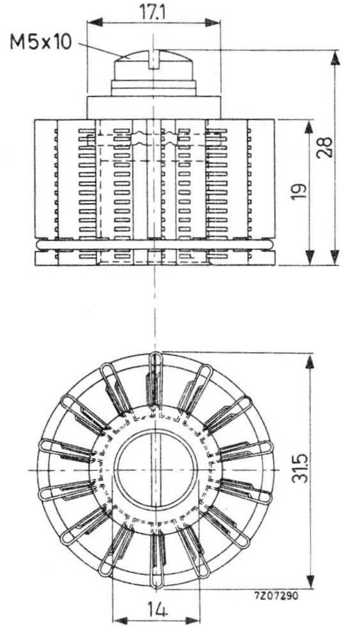
INSULATING PEDESTAL



Net mass 9,2 kg

ANODE CONNECTOR

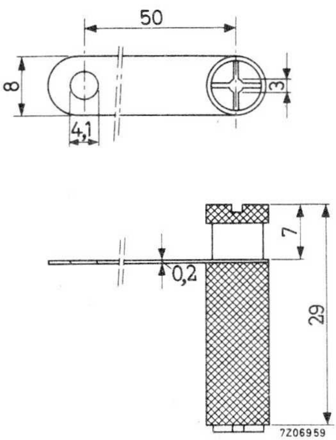
FOR TOP CAPS WITH 14..38 mm ϕ (IEC67-III-1b, type 3)



Material: brass, nickel plated

ANODE CONNECTOR

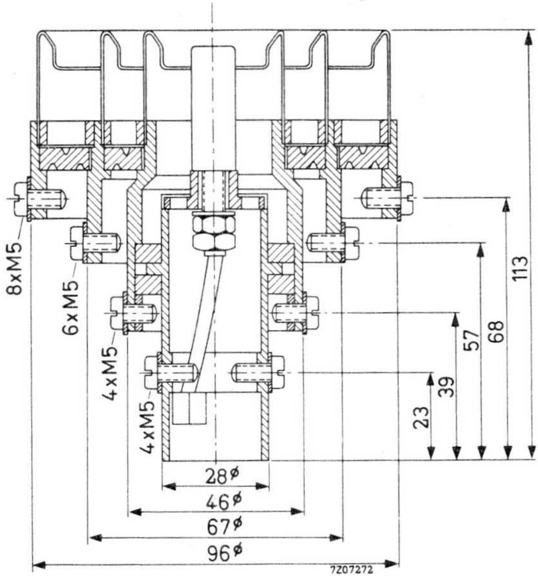
FOR 3 mm Ø TERMINALS



Material: brass, silver plated

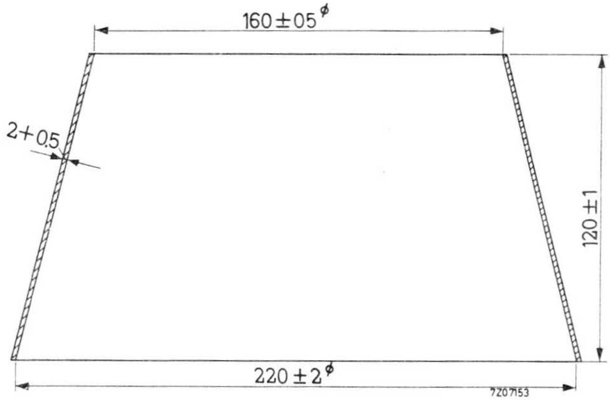
TUBE SOCKET

FOR 82 mm, 50 mm, 25,5 mm and 6 mm CONCENTRIC TERMINALS

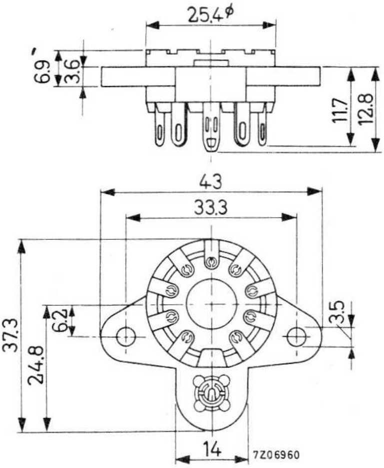


Material: synthetic resin insulating material
nickel plated contacts

CHIMNEY



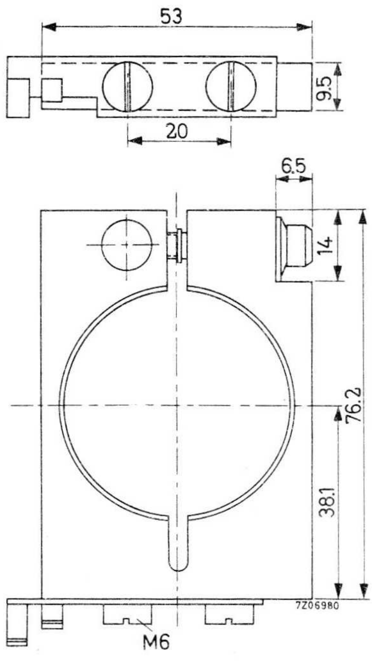
TUBE SOCKET FOR MAGNOVAL BASES



Material: synthetic resin insulating material
9 silver plated cup-shaped contacts

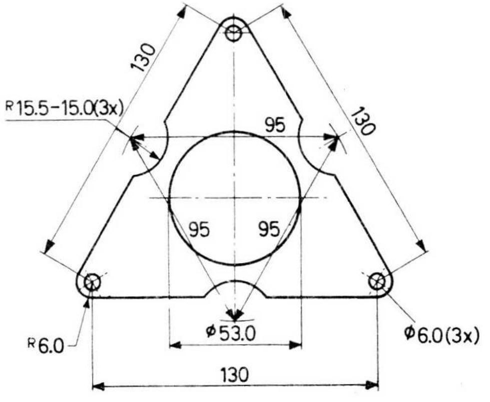
GRID CONNECTOR

FOR 48 mm ϕ TERMINALS



Material: brass, silver plated

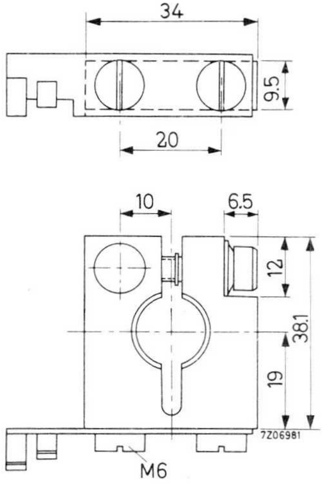
GRID CONNECTOR



Material: Brass

FILAMENT CONNECTOR

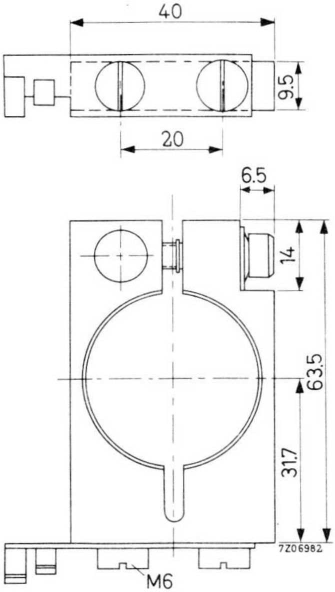
FOR 14.4 mm ϕ TERMINALS



Material: brass, nickel plated

FILAMENT CONNECTOR

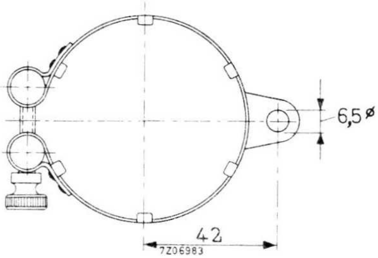
FOR 36 mm ϕ TERMINALS



Material: brass, nickel plated

GRID CONNECTOR

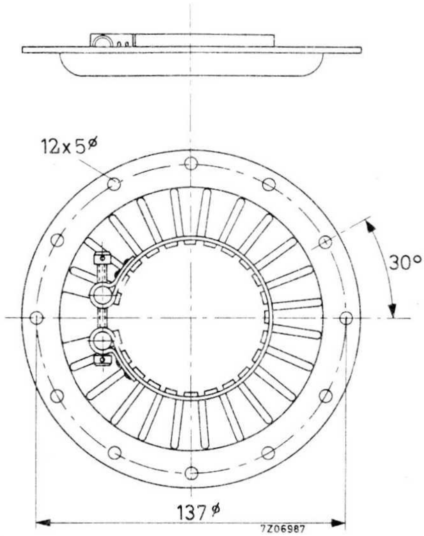
FOR 66 mm ϕ TERMINALS



Material: brass, nickel plated
Net weight: 55 g

GRID CONNECTOR

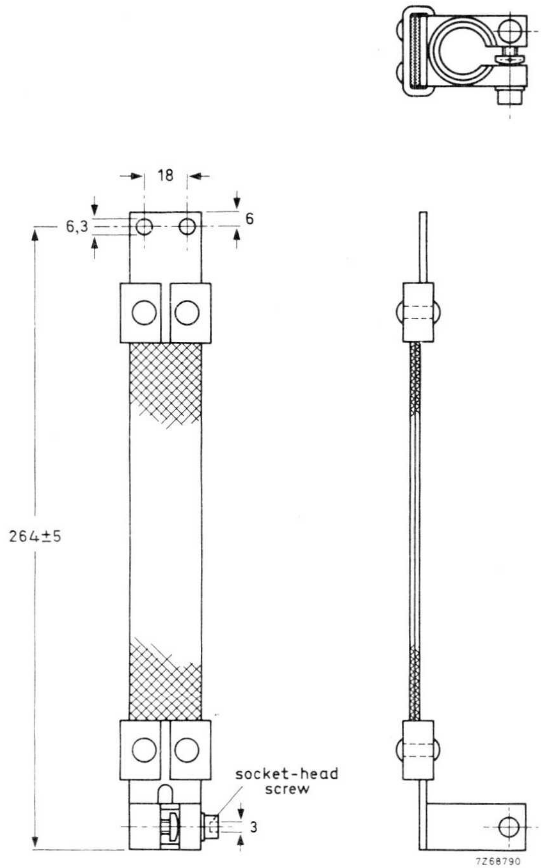
FOR 66 mm ϕ TERMINALS



Material: brass, silver plated
Net weight: 240 g

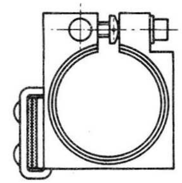
FILAMENT CONNECTOR
for 25 mm dia. terminals

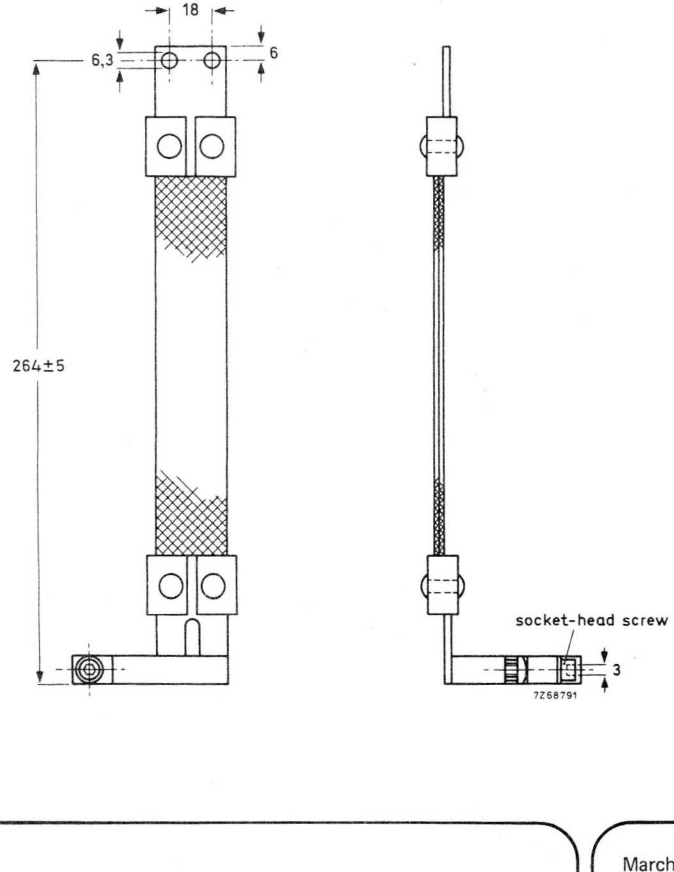
Net mass: ≈ 450 g



FILAMENT CONNECTOR
for 50 mm dia. terminals

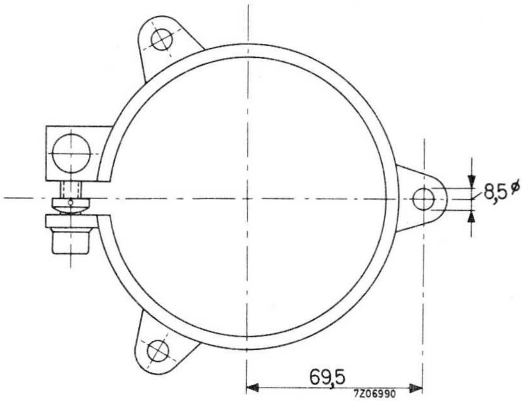
Net mass: ≈ 480 g





GRID CONNECTOR

FOR 112 mm ϕ TERMINALS

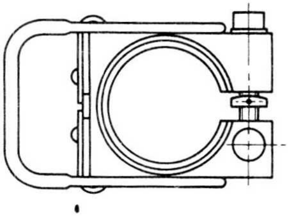


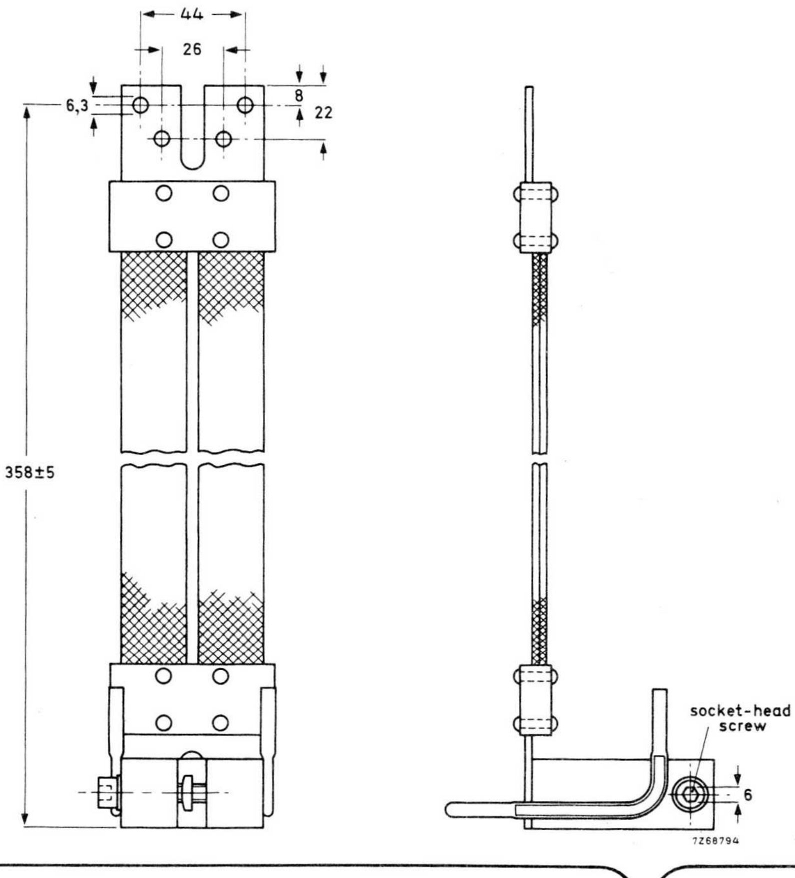
Material: brass, nickel plated
Net weight: 270 g

WATER-COOLED FILAMENT CONNECTOR

for 54 mm dia. terminals

Net mass: ≈ 1380 g

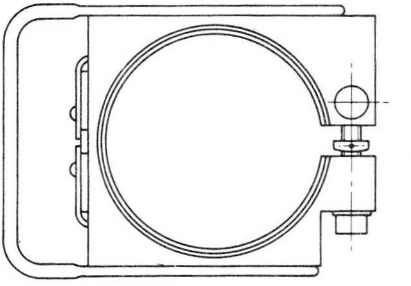


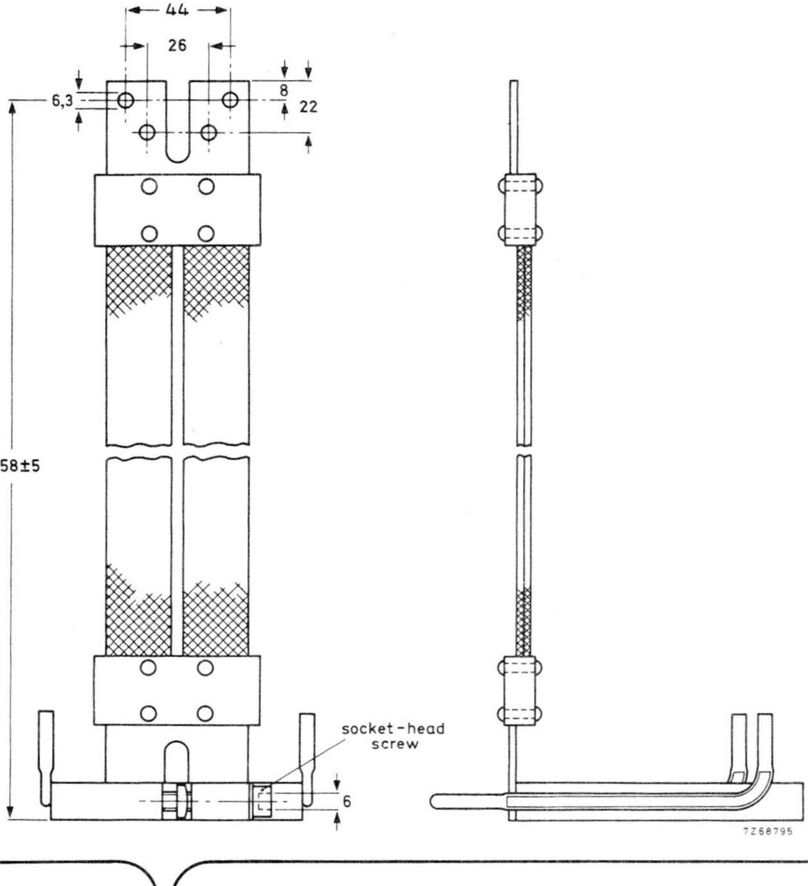


WATER-COOLED FILAMENT CONNECTOR

for 96 mm dia. terminals

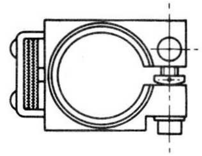
Net mass: ≈ 1550 g

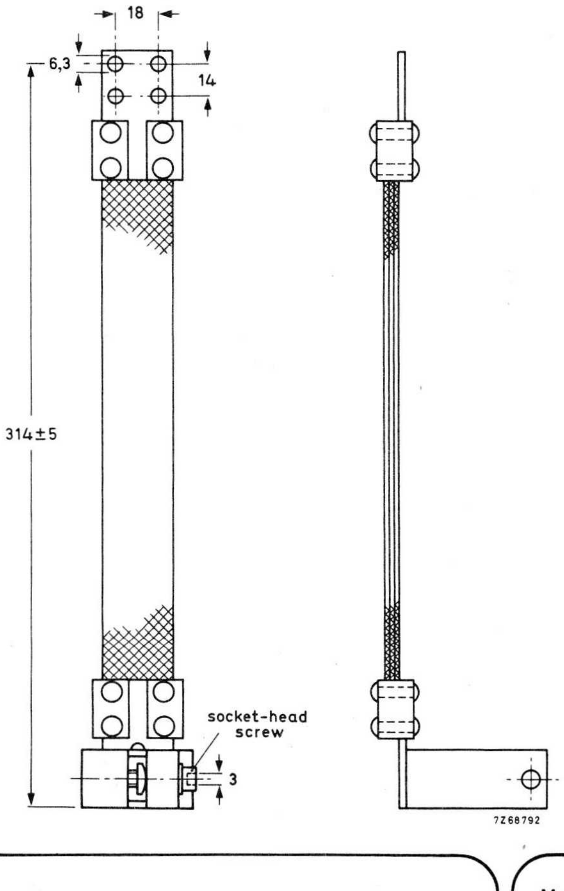




FILAMENT CONNECTOR
for 42 mm dia. terminals

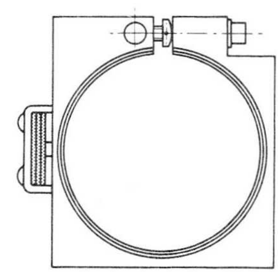
Net weight: ≈ 450 g

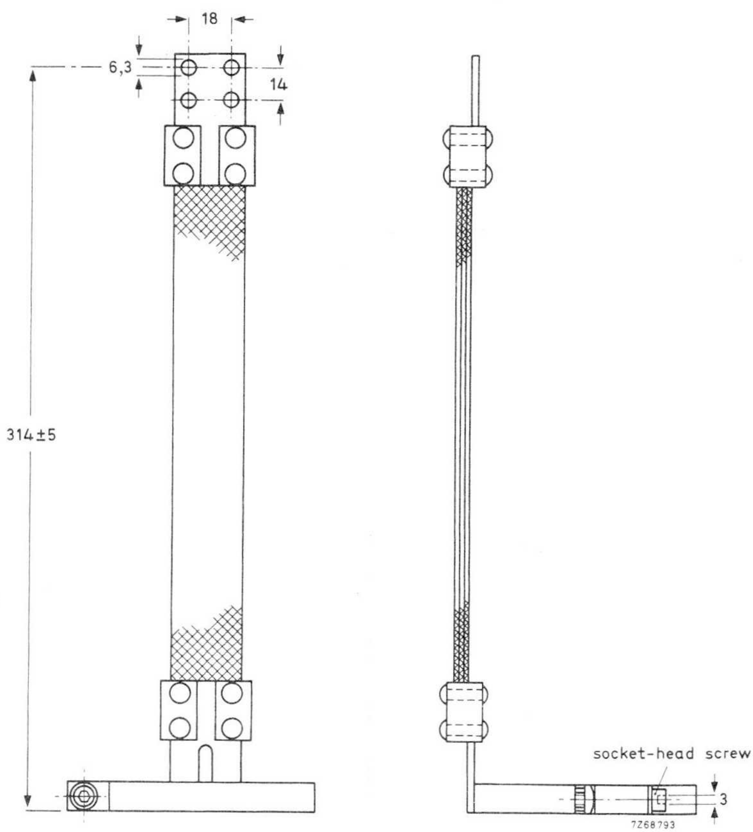




FILAMENT CONNECTOR
for 86 mm dia. terminals

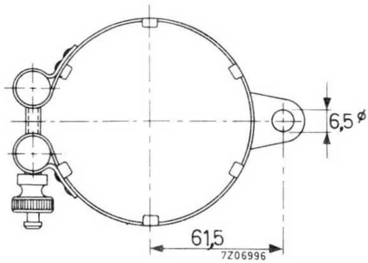
Net mass: ≈ 830 g





GRID CONNECTOR

FOR 105 mm ϕ TERMINALS

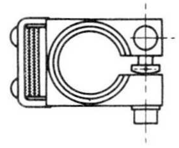


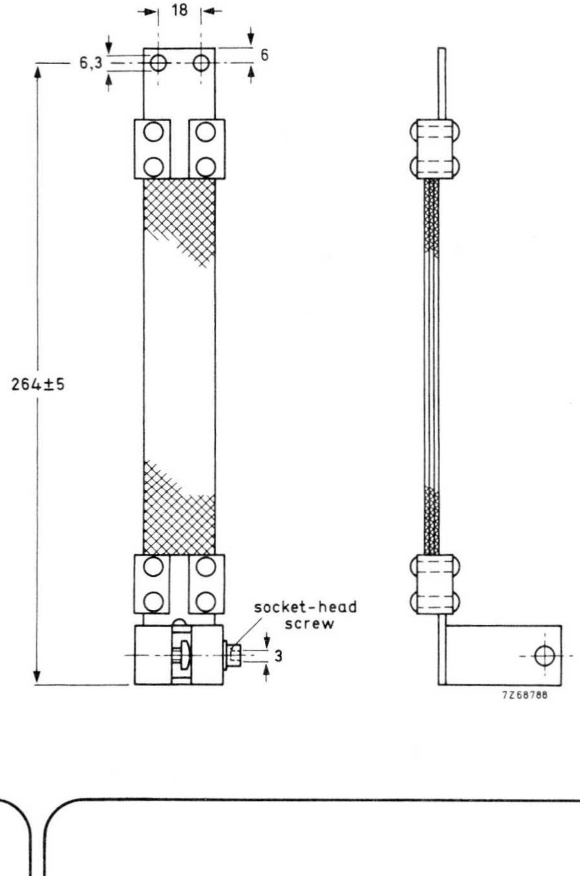
Material: brass, nickel plated

FILAMENT CONNECTOR

for 32 mm dia. terminals

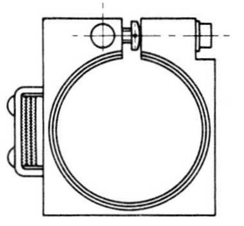
Net mass: ≈ 600 g

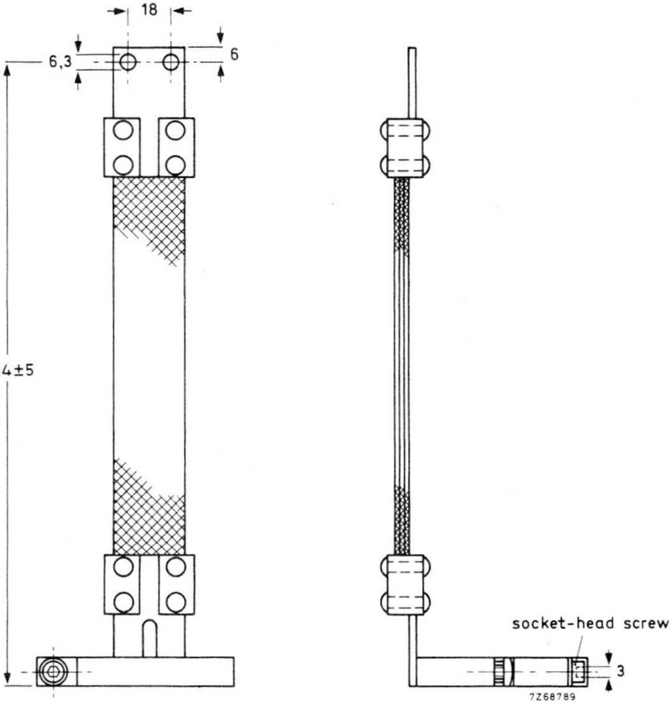




FILAMENT CONNECTOR
for 66 mm dia. terminals

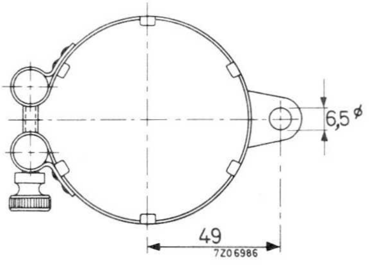
Net mass: ≈ 640 g





GRID CONNECTOR

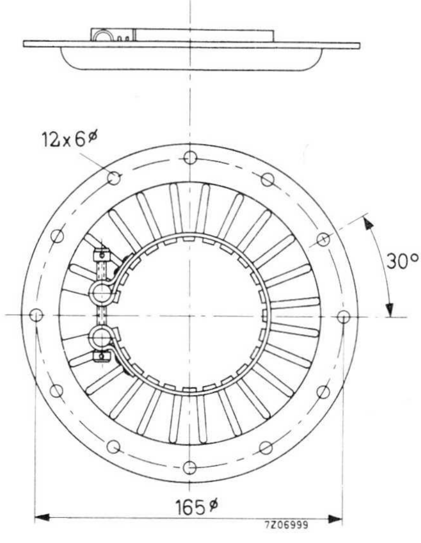
FOR 80 mm ϕ TERMINALS



Material: brass, nickel plated
Net weight: 60 g

GRID CONNECTOR

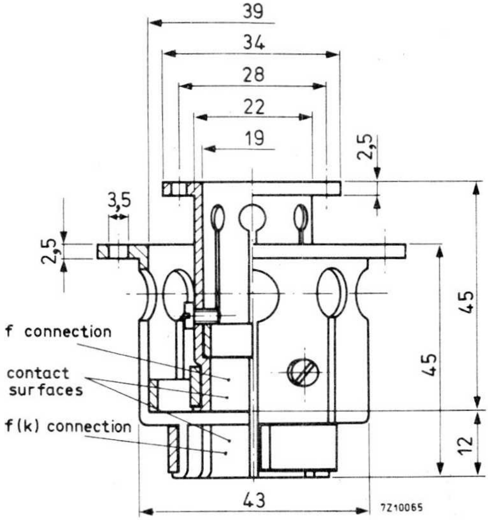
FOR 80 mm ϕ TERMINALS

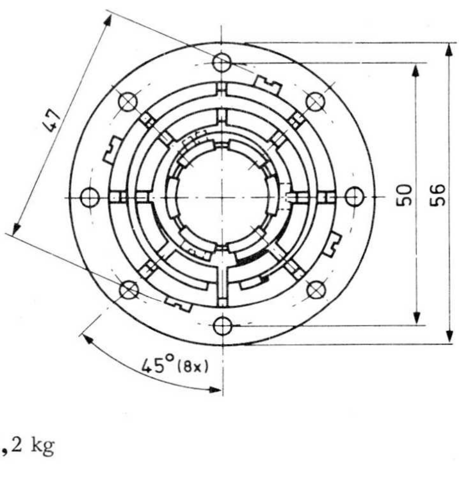


Material: brass, silver plated
Net weight: 310 g

FILAMENT CONNECTOR

FOR 27 mm and 17 mm CONCENTRIC TERMINALS

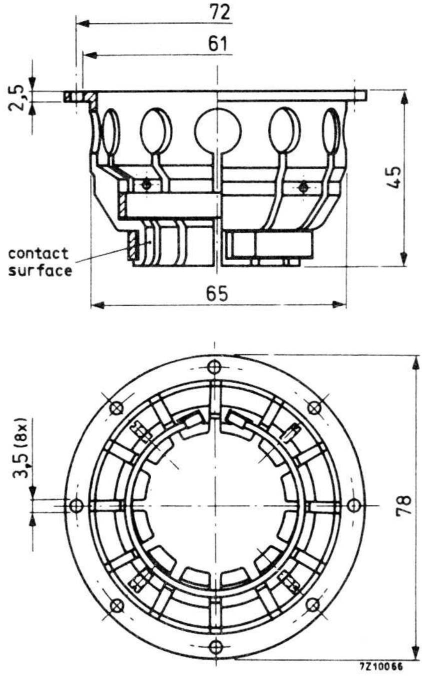




Net weight: approx. 0,2 kg

GRID CONNECTOR

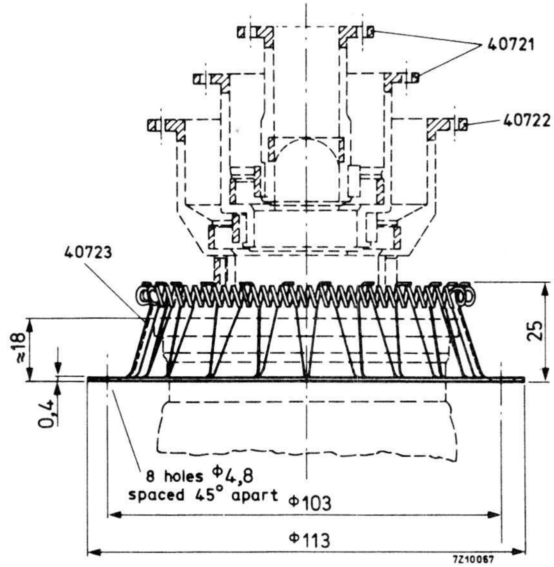
FOR 37 mm ∅ TERMINALS



Net weight: approx. 0,2 kg

SCREEN GRID CONNECTOR

FOR 79 mm ∅ TERMINALS

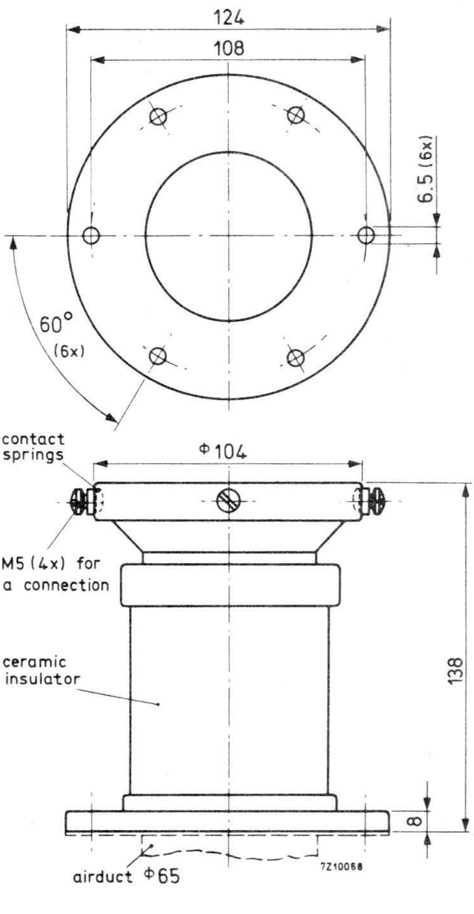


Net weight: approx. 0,1 kg

Caution

The tube must never be pulled through the spring ring.
So, if it has to be inserted from above, this should be done first, before the screen grid connection is made. Similarly, the tube can only be taken out after the screen grid connector has been removed.

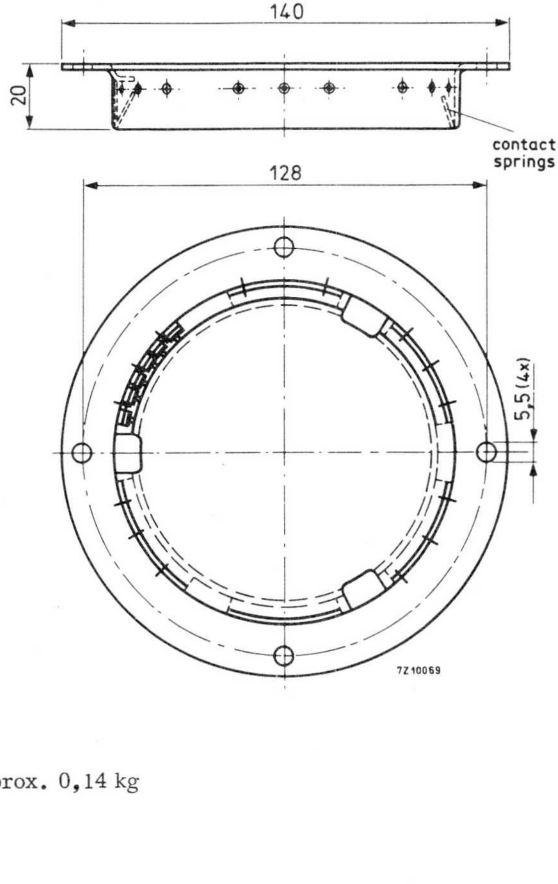
INSULATING PEDESTAL



Net weight: approx. 1.3 kg

GRID CONNECTOR

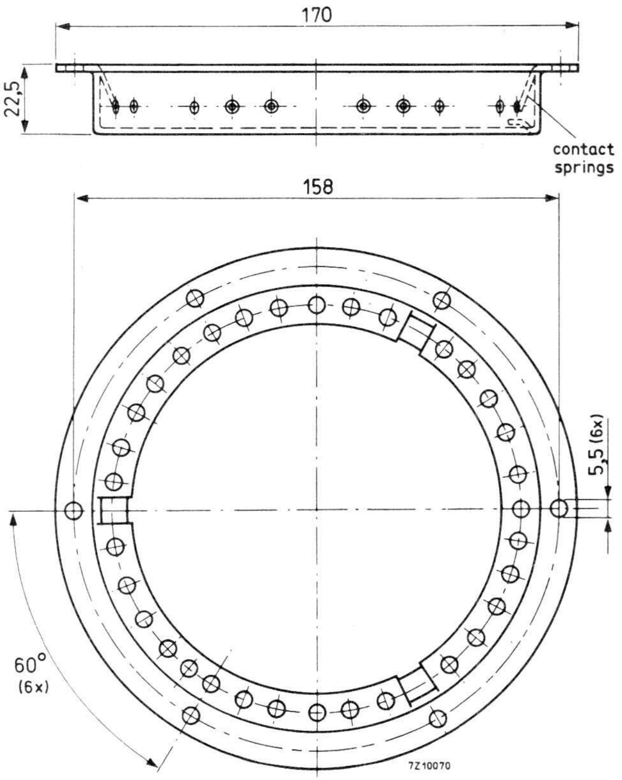
FOR 100 mm Ø TERMINALS



Net weight: approx. 0,14 kg

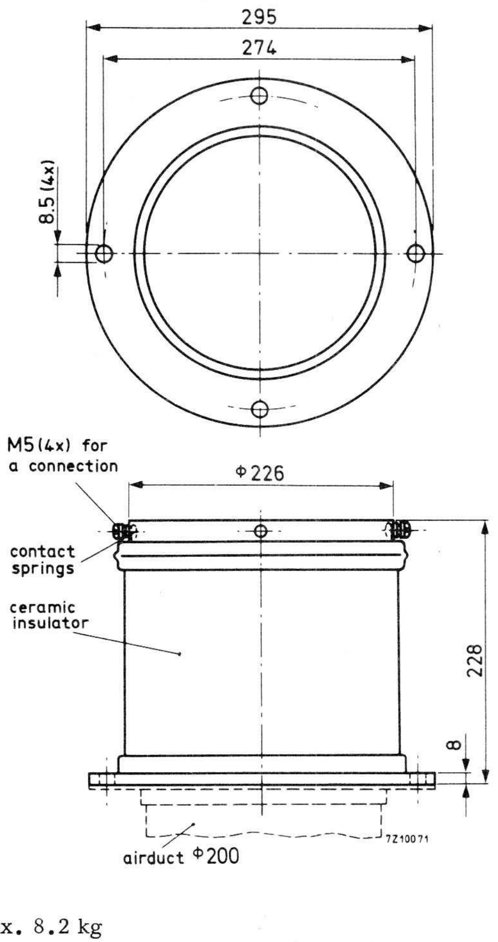
SCREEN GRID CONNECTOR

FOR 134 mm ∅ TERMINALS



Net weight: approx. 0,2 kg

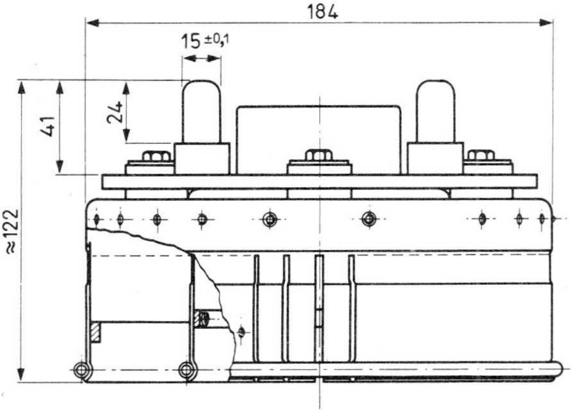
INSULATING PEDESTAL

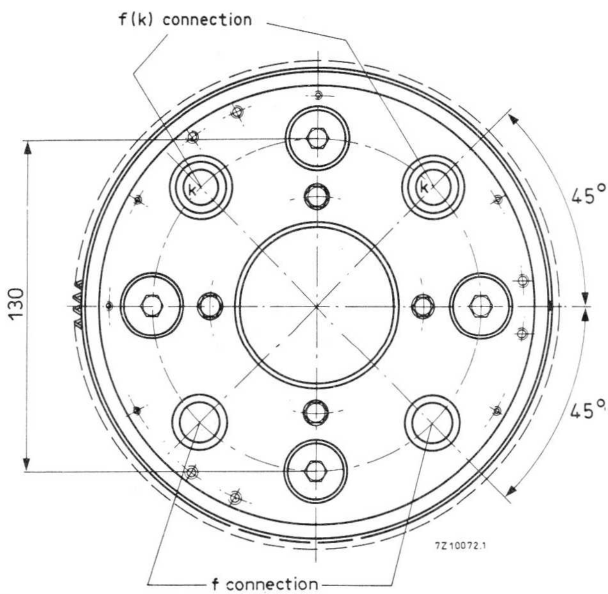


Net weight: approx. 8.2 kg

FILAMENT CONNECTOR

FOR 96 mm AND 40 mm CONCENTRIC TERMINALS

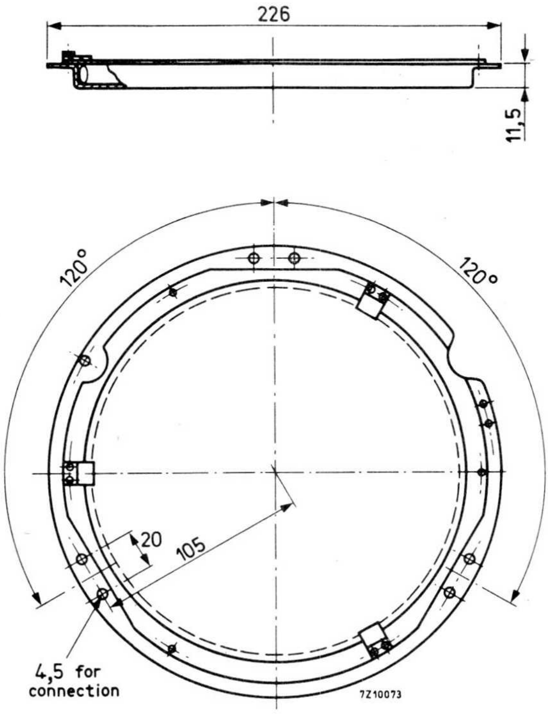




Net weight: approx. 2,5 kg

GRID CONNECTOR

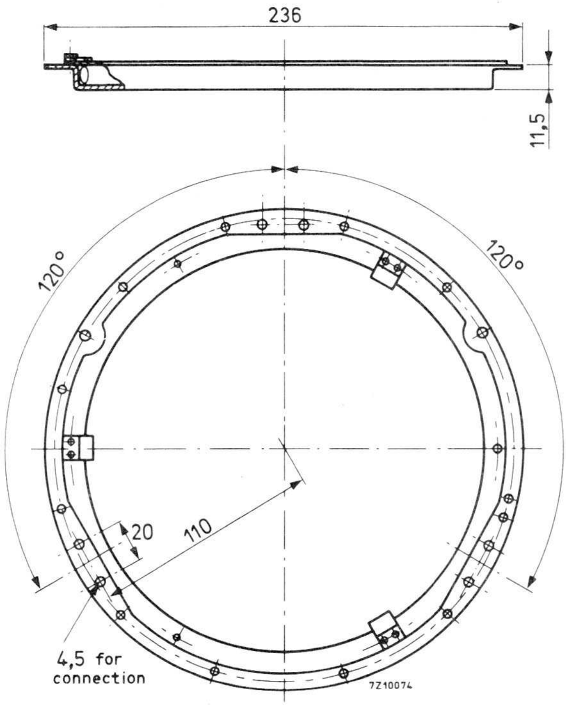
FOR 185 mm Ø TERMINALS



Net weight: approx. 0,35 kg

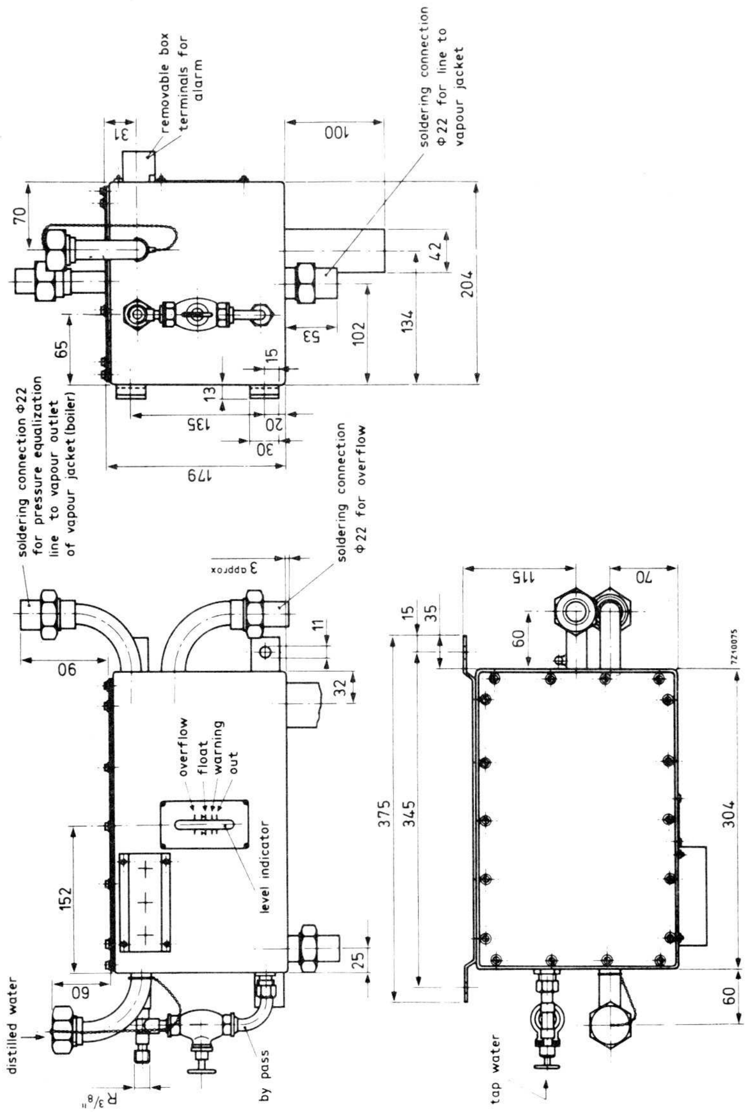
SCREEN GRID CONNECTOR

FOR 193, 2 mm Ø TERMINALS



Net weight: approx. 0,4 kg

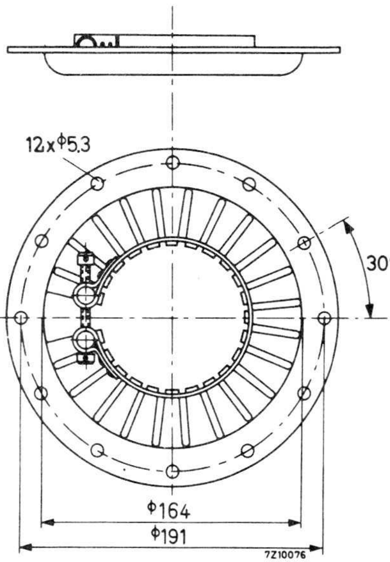
WATER LEVEL CONTROL



Material: Copper
Net weight: approx. 8.5 kg

GRID CONNECTOR

FOR 105 mm ϕ TERMINALS

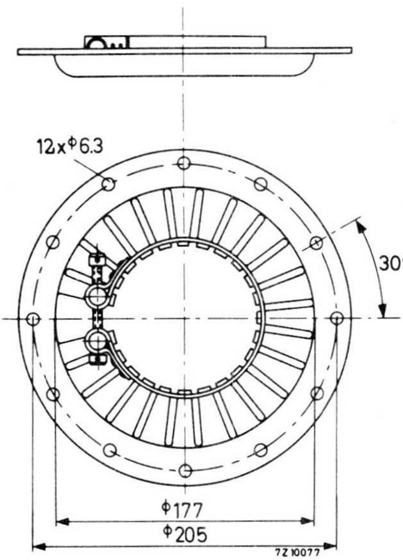


Material: brass, silver plated

Net weight: 450 g

GRID CONNECTOR

FOR 112 mm ϕ TERMINALS



Material: brass, silver plated
Net weight: 525 g
