• This value can be measured by a method involving a recurrent waveform such that the maximum ratings of the tube will not be exceeded.

▲ Pulse duration must not exceed 15% of a horizontal scanning cycle (10 microseconds).

† Adequate circuit precautions must be taken to protect the tube in the absence of grid-No.1 bias.

● Plate dissipations up to 32 watts maximum are permissible for short periods of time provided the maximum envelope-temperature rating is not exceeded. This condition may exist under high-line voltage, zero picture tube beam current.
